SECTION I FUNDING SUMMARIES

R-1 -	PE/BA/Program Category Data	1
	Object Classification Summary	5
PB-2A -	Program and Financing Schedule	6

SECTION II

MODERNIZATION AND INVESTMENT

R-2 - RDT&E BUDGET ITEM JUSTIFICATION SHEETS

0601101E	Defense Research Sciences	17
0602301E	Computing Systems & Communications Technology	31
0602702E	Tactical Technology	61
0602708E	Integrated Command & Control Technology	85
0602712E	Materials & Electronics Technology	89
0602XXE	Chemical and Biological Defense	113
0603226E	Experimental Evaluation of Major Innovative Tech	115
0603739E	Advanced Electronics Technologies	195
0603746E	Maritime Technology	227
0603800E	Joint Advanced Strike Technology	231
0603805E	Dual Use Applications Program	235
0605898E	Management Headquarters	239

SECTION III

MANPOWER

PB-31R -	Civilian Personnel Budget Calculation	241
PB-53 -	Military & Civilian Pay Raise Amounts	245
OP-8 -	Civilian Personnel Costs	246

SECTION IV

OTHER REQUIRED EXHIBITS

PB-15 -	Advisory and Assistance Services	250
PB-22 -	Management Headquarters	251
PB-23 -	Summary of Funds Budgeted for Environmental Projects	252

(U) **Mission Description:** This project supports the scientific study and experimentation that is the basis for more advanced knowledge and understanding in information sciences technology areas such as software foundations and environments, intelligent systems, human computer interface, language technology, microelectronic science, and high performance computing related to long-term national security requirements.

(U) In the area of software technology: advanced concepts are developed for methods and tools to produce high assurance software; language concepts that facilitate the rapid specification and evolution of systems; and techniques to manage complex structured data objects in larger heterogeneous, distributed information systems. The intelligent systems technology focus is on advanced techniques for knowledge representation, reasoning, and machine learning, which enables computer understanding of spoken and written language and images. Also included is advanced methods for planning, scheduling, and resource allocation. The focus in the human computer interaction technology area is design methods and enabling technology for more natural interaction between people and computers. Lastly, the high performance computing (HPC) focus is on science generated concepts and methods for validating and verifying design components, and unique approaches to rapidly develop high performance libraries across multiple HPC architectures.

(U) **Program Accomplishments and Plans:**(U) **FY 1996 Accomplishments:**

- Developed complex software languages and tools to integrate architecture-level representations of software systems and used these representations for analysis and testing. (\$7.6M)
- Enhanced advanced information processing methods in spoken language understanding, written language understanding and automated planning systems. (\$3.7M)
- Experimentally evaluated tool kits for interactive, dialogue-based human computer interaction. (\$4.2M)
- Refined and began experimental evaluation of design technology to include high performance computational prototyping of systems. (\$1.5M)
- Demonstrated utility of scalable libraries for defense tasking; completed basic research effort in scalable operating systems and runtime services; initiated Quorum architecture definition; and demonstrated adaptive computing systems for defense applications. (\$1.9M)

Defense Research Sciences,

PE 0601101E, Project CC5-02

- Developed theoretical classifications of ultrascale computational power. (\$2.1M)
- Experimentally evaluated planning and decision aids prototypes for heterogeneous, distributed software system architectures and tools to support construction and maintenance of advanced intelligent systems. (\$2.1M)

(U) FY 1997 Program:

- Complete the development of the tools and tool kits for development and evaluation of highly interactive, agent and dialogue-based human computer interactions. (\$4.7M)
- Advance the capabilities of spoken and written language understanding to solve real-world problems and provide widely usable functionality. (\$5.8M)
- Experimentally evaluate design technology for high performance computational prototyping of systems. (\$2.2M)
- Experimentally support software evolution by integrating numerous formal and informal information sources in a "hyperweb"; enhance formal notations for software design to include both syntactic and semantic information; and demonstrate multi-language architecture definition and analysis tools. (\$5.8M)
- Continue the experimental evaluation of supporting both task and data parallelism for scalable software library technology, and the utility of adaptive computing systems for defense applications. (\$1.2M)
- Demonstrate the feasibility of using ULTRASCALE computing techniques to store & retrieve information. (\$1.9M)
- Define Quorum architecture and validate findings, and define and validate the next generation of languages & runtime services for supporting parallel task applications. (\$1.9M)

(U) FY 1998 Program:

- Demonstrate symbolic simulation linked with hardware emulation for complex design technology. (\$2.0M)
- Complete the experimental evaluation of design technology for high performance computational prototyping of systems, supporting both task and data parallelism for scalable software library technology. (\$1.0M)
- Develop robust spoken and text language technologies with emphasis on affordable dialog grammars and understanding in spite of noise; all technology developed in response to systems experiments focused on critical military needs. (\$9.0M)
- Demonstrate a computational model using ULTRASCALE computing techniques. (\$5.0M)
- Evaluate the quality of service specifications relative to the Quorum architecture. (\$1.1M)
- Demonstrate the languages & runtime services in defense applications, and complete the scalable software library technology demonstration. (\$.9M)

COST (In Thousands)	FY 1996	FY 1997	FY 1998	FY 1999	FY 2000	FY 2001	FY 2002	FY 2003	Cost to Complete	Total Cost	
Electronic Sciences ES-01	37,217	42,007	42,004	44,345	33,478	36,533	31,533	37,533	Continuing	Continuing	

(U) Mission Description: This project seeks to continue the phenomenal progress in microelectronics innovation that has characterized the last decades through exploring and demonstrating electronic and optoelectronic devices, circuits and processing concepts that will: 1) provide new technical options for meeting the information gathering, transmission and processing required to maintain near real-time knowledge of the enemy, and the ability to communicate decisions based on that knowledge to all forces in near real-time, and 2) provide new means for achieving substantial increases in performance and cost reduction of military systems providing these capabilities. Research areas include new electronic and optoelectronic device and circuit concepts, operation of devices at higher frequency and lower power, extension of diode laser operation to new wavelength ranges relevant to military missions, development of uncooled and novel infrared detector materials for night vision and other sensor applications, development of innovative optical and electronic technologies for interconnecting modules in high performance systems, research to realize field portable electronics with reduced power requirements, research addressing affordability and reliability, and research on microelectromechanical systems (MEMS) technology.

(U) Program Accomplishments and Plans:

(U) FY 1996 Accomplishments:

- Continued investigation of revolutionary approaches to electronics enabled by very small scale devices (nanoelectronics) which operate in a regime where physical phenomenon not important in conventional devices dominate. Demonstrated that compound semiconductor nanoelectronic devices integrated with conventional devices results in significant reductions in chip area required for complex logic functions. Demonstrated the extension of nanoelectronic device designs to silicon-based devices, compatible with future integration with conventional silicon circuits. (\$12.3M)
- Demonstrated optical materials and device designs that enable an order of magnitude reduction in threshold current requirements for diode lasers, demonstrated a means for increasing the bandwidth for direct laser modulation by 25%, and demonstrated technology for applying arrays of optical devices for applications in future high-speed, high capacity switching systems. (\$4.4M)
- Demonstrated photonic device applications of non-semiconductor thin films doped with optically active ions and explored material technologies for monolithically integrated optoelectronic components. (\$3.0M)

APPROPRIATION/BUDGET ACTIVITY RDT&E, Defensewide BA 1 Basic Research		R-1 ITEM NOMENCLATURE Defense Research Sciences, PE 0601101E, Project ES-01	
<ul style="list-style-type: none"> • Demonstrated development of high-density integrated electrical/mechanical MEMS along with requisite developments of CAD tools, materials data base, test and characterization methods, and manufacturing processes. (\$6.2M) • Initiated development of uv-blue gallium nitride based LEDs and lasers for high density memory, lightwave countermeasures, covert communications, and warfare. (\$5.5M) • Assessed thermal response characteristics of thin film material for improved sensitivity uncooled infrared detectors. (\$.8M) • Continued low-power electronics program in the area of circuit architecture and power management techniques. Demonstrated Computer Aided Design (CAD) tool for modeling low power circuit designs and estimating circuit static power dissipation. (\$5.0M) 			
(U) <u>FY 1997 Program:</u> <ul style="list-style-type: none"> • Continue the ultra-electronics program with emphasis on the following thrusts: combined nanoelectronics and conventional electronics, silicon-based nanoelectronics, chemical self-assembly, and molecular beam epitaxy (MBE) process control and other fabrication techniques. (\$11.0M) <ul style="list-style-type: none"> - Demonstrate potential for chemical self-assembled films' use in nanoelectronics. - Demonstrate precision process control of semiconductor heterostructures for advanced nanoelectronic devices. - Demonstrate improved patterning with critical dimensions below 50 nanometers. • Demonstrate monolithically integrated optoelectronics for information processing and demonstrate feasibility of three-dimensional optically addressed memory. (\$5.7M) • Fabricate small (5 x 5) infrared sensitive arrays as verification of material properties. (\$3.0M) • Develop and demonstrate efficient low-voltage conversion/distribution circuits and self-regulating, use-driven power allocation systems. (\$6.7M) • Develop and demonstrate uv pulsed laser operation in the gallium nitride system. Identify relationship between defect density and applicability to military applications such as uv solar blind detectors for missile threat warning. (\$10.0M) • Continue low-power electronics program in the areas of circuit architecture and power management techniques. Demonstrate 256 x 256 pixel sensor with on-chip 10-bit Analog to Digital Converter (ADC). Demonstrate strategies for non-disruptive power supply switching for reduced power consumption. (\$5.6M)

R-1 ITEM NOMENCLATURE
Defense Research Sciences,
PE 0601101E, Project ES-01

(U) FY 1998 Program:

- Optoelectronics - Demonstrate feasibility of using Gallium Nitride detectors as a UV solar-blind detector for missile threat warning and demonstrate UV/blue lasers operating continuous wave for high density memory and chemical/biological detection. (\$10.9M)
- Infrared Detector Materials - Determine process for low temperature deposition of thin film uncooled materials. (\$3.0M)
- Ultra-Electronics - Demonstrate feasibility of combining a resonant tunneling device (RTD) with conventional devices, silicon based quantum MOS technology, and simple quantum cellular automatic logic circuits using silicon and silicon germanium structures. (\$11.6M)
- Ultra-Photonics - Demonstrate practical means for implementing high speed optical buffer memories and signal address recognition based on coherent all-optical (photon-echo) technology. Demonstrate the utility of low cost silicon electronic devices doped with optically active elements (such as Erbium) for applications that are now the exclusive domain of more expensive compound semiconductor devices or glassy materials. (\$10.6M)
- Low Power Electronics - Complete low-power electronics programs in the areas of circuit architecture and power management techniques. Demonstrate 256 x 256 pixel image sensor with on-chip 10-bit Analog-Digital Converter. (\$5.9M)

(U) FY 1999 Program:

- Infrared Detector Materials - Establish feasibility of new uncooled detector structures, including micromachined arrays, thin film ferroelectrics and bolometric materials. (\$3.0M)
- Ultra Electronics - Demonstrate programmable matched filter operating at gigahertz speed with substantially less power than silicon complementary metal oxide semiconductor (Si CMOS), completely integrated molecular beam epitaxy (MBE) growth system which realizes closed-loop control of atomic layer growth and quantum device structures. (\$4.9M)
- Ultra-Photonics - Identify the device properties limiting performance of vertical cavity lasers and demonstrate methods for controlling their output beam quality. (\$7.7M)
- Advanced Microelectronics - Explore new concepts, directed at demonstrating feasibility of radical device and systems architecture concepts. Of particular emphasis will be device concepts in microelectronics and optoelectronics enabled by technology advances in related areas, particularly those in sub 0.1 micron lithography and mixed-technology integration. (\$13.7M)
- Integrate promising new elements of ultra-electronics, high power electronics, non-volatile memory and Electro-Magnetic Interference (EMI) electronics to address current thrusts in smaller, lighter, more mobile information systems and highest performance components and systems. (\$15.0M)

(U) **Mission Description:** This project is concerned with the development of: high power density/high energy density mobile and portable power sources (including batteries and fuel cells); forward combat casualty care medical technologies; technologies for defense against biological warfare agents; magneto-resistive materials for use in radiation hardened memories and motion sensors; advanced thermoelectric materials for cooling and power generation; processing and design approaches for nanoscale and/or biomolecular materials and interfaces; and medical pathogen countermeasures.

(U) **Program Accomplishments and Plans:**

(U) **FY 1996 Accomplishments:**

- Electrochemistry. (\$10.4M)
 - Developed and demonstrated a high efficiency fuel reformer for fuel cell applications to process logistic fuel (e.g., DF-2, JP-8).
 - Demonstrated fuel cell operation using either hydrogen or methanol with performance adequate for soldier applications.
 - Tested a novel direct oxidation logistics fuel cell concept.
- Biomedical. (\$1.7M)
 - Exploited technology base developments in microelectronics, sensors, communications, imaging and simulation to enhance far-forward combat casualty care. This project provides component and modular additions to the Personnel Status Monitor (PSM) under development in PE 0602712E, project MPT-07.
 - Accelerated development of a Ranger Overwatch personnel status monitor (RO-PSM) with standard PSM configuration and added temperature and shiver sensors to detect hypothermia.
 - Developed haptic interface for virtual environments and holographic display for virtual images in simulation.
- Biological Warfare (BW) Defense. (\$3.2M)
 - Continued development of technology for antibody deposition on chips for real-time BW sensing.
 - Initiated structure-based design of antibody combining site for spore identification.
 - Initiated engineering analysis for miniature environmental air sampler to transfer biological materials into fluids.

- Demonstrated the feasibility (in the laboratory) of using red blood cells and stem cells to eliminate pathogens from the blood for the purpose of potential defense against biological weapons.
- Magnetic Materials and Devices. (\$2.3M)
- Demonstrated enhanced magneto-resistance ratio at low magnetic fields for faster response and higher sensitivity of magnetic devices.
- Evaluated spin transistor and spin tunneling devices for use in sensors and non-volatile memories.

(U) FY 1997 Program:

- Electrochemistry. (\$8.6M)
- Develop and test a thermally integrated fuel cell stack and reformer which operates on logistics fuel.
- Demonstrate direct oxidation, liquid-feed methanol fuel cell stack operation with performance adequate for soldier applications.
- Biomedical. (\$1.7M)
- Develop miniaturized and rechargeable polymer power sources for the Personnel Status Monitor (PSM); augment sensor suite with "sensitive liner" intelligent clothing.
- Magnetic Materials and Devices. (\$1.4M)
- Fully characterize spin transistor and other spin polarized transport devices for use in ultra-high density memory applications.

(U) FY 1998 Program:

- Electrochemistry. (\$11.5M)
- Construct and test a logistics fueled fuel cell power plant for mobile electric power applications.
- Begin component and system study/demonstration of a direct oxidation fuel cell for replacement of military standard batteries.
- Explore alternative sources of energy for portable power applications.
- Develop and demonstrate thermoelectric materials with significantly improved figure of merit.
- Nanoscale/Biomolecular Materials. (\$1.5M)
- Exploit recent advances in materials design and processing to demonstrate nanostructural control of materials properties with an emphasis on emulating the complex microstructure and scale of biological materials.
- Pathogen Countermeasures. (\$2.0M)

(U) Mission Description: This project develops new information processing technology concepts that lead to fundamentally new software and intelligent systems capabilities. This will enable advanced information systems to more effectively accomplish decision-making tasks in stressful, time sensitive situations and create efficient software systems supporting computer and software intensive defense systems. Major areas of technical emphasis are: (a) intelligent systems (artificial intelligence) including autonomous systems, image understanding, interactive problem solving and intelligent integration of information from heterogeneous sources; (b) software development technology including languages, algorithms, data and object bases, domain specific software architectures, software prototype technology, software design tools, software reuse, and advanced software engineering environments; (c) manufacturing automation and design engineering, including the development of advanced software systems which support sharing of engineering knowledge, advanced product and process design representations, integrated product and process design, software tools for design process management, manufacturing process planning, manufacturing process control and demonstrations; (d) Text Video Speech (TVS) technology focusing on the integration and application of emerging language understanding technology for both C4I and Intelligence community needs; and (e) organizing resources to obtain access to multiple systems and decision aids that provide logistical information when and where it is needed.

(U) Program Accomplishments and Plans:(U) FY 1996 Accomplishments:

- Demonstrated and evaluated advanced reconnaissance, surveillance, and target acquisition algorithms on unmanned ground vehicle; installed baseline RADIUS Site Monitoring System at National Photographic Interpretation Center; delivered first version image understanding environment. (\$10.9M)
- Experimentally evaluated implementations for human-aided machine language translation, document understanding, and robust speech understanding in adverse acoustic conditions. (\$12.9M)
- Experimentally evaluated implementations of real-time planning and control algorithms. (\$1.8M)
- Evaluated knowledge-based planning and decision aids to support the rapid construction of multiple crisis action plans in an operational exercise. (\$9.5M)

- (U) **Mission Description:** This project develops the computing, networking, and associated software technology base underlying the solutions to computational and information-intensive applications for future defense and federal needs. These technologies lead to successive generations of more secure, higher performance, and more cost-effective scalable systems associated software technologies, advanced mobile information technology and prototype experimental applications critical to defense operations. The High Performance Computing program is comprised of the following components:
- Global Mobile Information Systems effort deals with the activities required for defense-based mobile systems, including modal architectures, adaptive extensions, changing resources and robust mobile services.
 - The Systems Environments component develops scalable software which is tailored toward easing the use of systems by application programmers. This includes languages, run-time services, scalable software library technologies, and experimental applications.
 - The Networking component develops high performance networking technologies and associated network management capabilities. Research is coordinated with network technology and Service deployments made by DoD, NASA, and other federal agencies.
 - The Scalable Systems and Software component develops software and hardware technologies leading to a secure scalable computing and communications technology base for systems configured over a wide performance range, from mobile handheld devices to desktop workstations to the largest-scale, highest performance systems.
 - The Microsystems component develops design tools, environments, and design infrastructure to support the research and development of advanced scalable parallel computing components and embedded computing systems. Microsystems is the incubator and delivery mechanism of future generation defense advanced information systems components. Microsystems is the critical bridge that leverages other DARPA technology in low-power processes, advanced packaging, materials, and electronic componentry to develop the critical architecture and building blocks of the most advanced defense computing and communication systems.
 - Defense Technology Integration and Infrastructure combines state-of-the-art computing and information technologies focused on critical defense applications. These include developing embeddable systems based upon scalable technologies, and projects which accelerate technology transition of advanced research to intelligence, command and control, and other major DARPA and DoD programs. Technologies addressed include

- Scalable Systems and Software. (\$37.6M)
 - Demonstrated user-extensible microkernel operating system technology, integrating compiler and run-time support services; computing node architectures that dramatically increase internal memory and communications bandwidths; and I/O enhancements to a scalable operating system that overcomes identified bottlenecks leading to significant improvements in throughput.
- Microsystems. (\$34.7M)
 - Performed early demonstration of parallel, fully-hierarchical Automatic Test Generation for both combinational and sequential circuits.
 - Demonstrated fault-tolerant and reliability design tools supporting large-scale HPC systems developments; distributed computing architectures based on low-cost, low-latency switching technology; and integrated module-level synthesis capability.
 - Prototyped emulation-enhanced system simulation capabilities for microsystems design.
 - Developed highest performance open interconnect component for embedded defense systems, future demos in various systems, missiles and satellites.
 - Designed message-passing/shared-memory hybrid architecture protocol accelerator component.
 - Defense Technology Integration and Infrastructure. (\$41.2M)
 - Developed and provided experimental testbed services employing advanced high performance computing technologies for defense users; and prototype distributed, object-oriented architecture for scalable, interoperable, multimedia digital library repositories.
 - Prototyped embedded computing system modules with scalability concepts containing memory hierarchy and power on a single unit of replication.
 - Performed integration tests in key defense applications such as advanced distributed simulation, advanced distributed collaboration, advanced communications and control, and advanced human computer interfaces.
 - Demonstrated first fine-grained high performance embedded and scalable computer system; graphical program environments for embedded systems; prototype toolkits supporting development of applications adaptive to changes in the computing and communication environment; and prototype of information services through a testbed incorporating information management and secure transactions.
- Metacomputers. (\$7.7M)
 - Established a metacomputing center testbed in the National Capital Region.

- Ultrascale Computing.
 - * Design ultrascale quantum architecture model that addresses error-correction, computation in a noisy environment, and multipin entanglements; and develop and exercise computing simulator computation model to evaluate parallel behavior and performance structure.
- QUORUM.
 - * Define and integrate architecture, and develop quality-of-service specification language.
 - * Demonstrate order of magnitude performance improvement of translucent system layers using network-attached secure disks.
- Microsystems. (\$32.5M)
 - Microsystems Design.
 - * Release comprehensive complex system design benchmark suite.
 - * Draft specifications for common descriptive format for complex system design hardware verification.
 - * Demonstrate multi-site parallel processing design colabatory; formal methods for early complex system design microprocessor verification; sequential complex system design processor verification; and integrated environment spanning of advanced parallel processing microcomponents.
 - * Develop complex system design functional error modeling and test generation.
 - Adaptive Computing Systems.
 - * Develop 1 million gate standard form factor boards and hybrid system prototypes using configurable component technology; automatic process of template design and integration (for ATR library templates).
 - * Demonstrate 10x performance improvement of user-level software on challenge problems.
- Defense Technology Integration and Infrastructure. (\$35.1M)
 - Prototype System of Systems.
 - * Develop prototype Mediated Link application.
 - * Evaluate the experimental Mediated Link on a LAN.
 - * Evaluate Phase II feasibility and cost; and complete Phase II Program Plan.
 - Information Management.
 - * Deploy net-accessible prototype demonstrating vocabulary switching and object categorization; deploy operational prototype with active references to technical literature to licensed institutions.
 - * Develop scalable information value framework to characterize prior use of objects; and testbed for electronic deposit, registration and recordation of digital objects.
 - * Demonstrate agent architecture for cross-collection search and results fusion.

(U) FY 1999 Program:

- Global Mobile Information Systems. (\$16.8M)
 - Demonstrate distributed computing in mobile application support environment; continuous networking mobility between wireless domains; and integrated high data-rate untethered node.
- Systems Environments. (\$14.2M)
 - Demonstrate experimental scalable image processing application using DARPA embedded systems platform.
- Networking. (\$34.3M)
 - High Performance Networking.
 - * Demonstrate Interoperable Execution Environments on multiple, high-end workstations for packet formats, languages and protocols.
 - * Complete evaluation of high-performance subsystem in a testbed and demonstrate the scalability of subsystems in defense application.
 - Networking Engineering.
 - * Evaluate prototype robust distributed, large-scale, network engineering management systems in a testbed.
 - Demonstrate reliable service foundation for routing, multicast, and location-aware Enhanced Networking Services on multiple high end workstations.
 - Active Networks.
 - * Initiate operation of secure Enhanced Networking Services proxies crossing independent administrative domains; of Enhanced Network Services on Active Network Testbed across ~10 sites of ~10 switches each; and of Active Network Testbed across ~10 sites of ~10 switches each using composite protocols.
 - * Release initial formal specification and composite protocols of Enhanced Networking Services for critical review.
 - * Demonstrate resource protection, security, and survivability functions as defined in goals and composite protocols.
- Scalable Systems and Software. (\$47.9M)
 - Scalable Computing Systems.
 - * Release efficient, high-speed, parallel signaling design scripting tools.
 - * Demonstrate 32-port, fault-tolerant switch performance at 2.5 Gbps/wire signaling rate, ultra low power; and performance of 4 Gbps/wire backplane switch technology and release designs.

R-1 ITEM DESCRIPTION

Computing Systems and Communications Technology,
PE 0602301E

- Ultrascale Computing.
 - * Conduct system-level detailed design study of a computation model and design/fabricate/demonstrate testbed prototype of a computation model concept.
 - * Demonstrate silicon/neuronal information transfer mechanism; distributed sensor model application on amorphous array with >1,000 elements; and feasibility of DNA computation mechanisms on 64,000 component surface.
- QUORUM.
 - * Integrate multi-attribute quality-of-service specification language architecture.
 - * Demonstrate dynamic quality-of-service architecture in LAN; order of magnitude improvement in operating systems/network; fast, multiconstraint, adaptive resource discovery and allocation in LAN environment; and LAN-based, quality-of-service, integrated assurance for Quorum Prototype #2.
- Microsystems. (\$32.0M)
 - Microsystems Design.
 - * Verify out-of-order execution superscalar processor for complex system.
 - * Demonstrate formal complex system design verification techniques; and distributed parallel processing computation with remote visualization.
 - * Develop first 21st-century, parallel processing microsystems through distributed approach-prototype environment provides open access.
 - Adaptive Computing Architectures.
 - * Debug and validate novel, configurable component technology architectures, and develop ability to auto map 500,000 gates and demonstrate estimators.
 - * Demonstrate 100x user-level software performance improvement over commodity microprocessors on challenge problems, and release new algorithm design software environment optimized to leverage adaptive software technology.
- Information Management. (\$14.0M)
 - Develop framework for combined text, image and relational interoperation.
 - Demonstrate translingual query by entering English language query and retrieving documents in at least two foreign languages; and semi-automatic topic assignment for unrestricted documents with acceptable accuracy.
 - Validate design of secure repository architecture for digital objects up to 100 MB in size.

(U) **Mission Description:** Software is key to meeting DoD's increasing demand for quality, affordability, and timeliness of national defense systems. There is a critical need to rapidly transition state-of-art technology and best practices to improve the acquisition, engineering, fielding, and evolution of software-intensive L&D systems. This project funds the technology transition activities of the Software Engineering Institute (SEI) at Carnegie Mellon University. The SEI is a DARPA sponsored Federally Funded Research and Development Center (FFRDC). It was established in 1984 as part of the DoD's software initiative to identify high leverage technologies and practices and to establish transition mechanisms that enable technology exploitation by both "in-house" government facilities and the industrial base where the bulk of defense software is produced. The Institute works across government, industry, and academe to: (1) improve current software engineering practice for DoD systems; (2) provide value-added transition of technology to practice; and (3) evaluate and calibrate emerging technologies to determine their potential for improving the evolution of software-intensive DoD systems.

(U) The SEI enables the exploitation of emerging software technology by bringing engineering discipline to software development and evolution. The SEI focuses on software technology areas judged to be of the highest payoff in meeting defense needs. Current focus areas include Trusted Systems and Information Warfare, Software Acquisition Risk Management, Architecture-Centered Software Engineering, and Software Processes and Process Improvement.

(U) Program Accomplishments and Plans:

(U) FY 1996 Accomplishments:

- Improved practice of software engineering for DoD systems -- validation of Capability Maturity Model (CMM) as guide to effective software process; education in Personal Software Process to improve performance of individual engineers; repository of software risk management experience; guide to current practice of software reengineering; guidelines for adoption of CASE tools; and case studies of product line engineering. (\$8.0M)
- Evaluation of software technology to facilitate transition -- guide to software architecture description languages; approaches to architecture evaluation and comparison; lessons learned in software technology evaluation; and software process measurement guidebook. (\$7.0M)

R-1 ITEM MONOCLATURE

Computing Systems and Communications Technology,
PE 0602301E, Project ST-22

- Technology focus in trusted software and information warfare -- continued operation of CERT team for network incident responses; SIMPLEX architecture approach to providing safety net for system evolution; quality attribute framework to provide taxonomy for four software quality attributes: safety, performance, dependability, and security. (\$2.0M)
- Supported the creation of a software engineering professional structure and broad dissemination of knowledge to the government, industrial, and academic communities. (\$3.6M)
- Software managers network effort supported by the development and application of active learning tools for senior level management. (\$5.7M)

(U) FY 1997 Program:

- Practice improvement: Integrate and enhance models for software processes, process improvement methods, and analytical capabilities to provide common base for process assessments and improvement analysis. Design and establish repository for DoD software risk management experience that is useful to DoD acquisition managers. (\$5.7M)
- Technology evaluation: Expand and improve architecture-centered technologies for product lines and evolutionary systems to develop consensus on guidelines for domain engineering, system reengineering, and open systems. Investigate team approaches to provide improved collaboration capabilities and information dissemination in DoD software development efforts. (\$5.1M)
- Trusted software and information warfare: Develop pilot models for assessing information system survivability. Establish techniques for applying architecture-centered technologies to support the representation and analysis of trust attributes. Study effective countermeasures for information warfare against software-intensive systems including: security risk taxonomy and guidelines, security analysis tool kits, and guidelines for the acquisition of trustworthy open systems. (\$7.3M)

(U) FY 1998 Program:

- Improve practice of software engineering for DoD systems -- Automate process support capabilities by providing mechanisms that provide interoperability among heterogeneous design and manufacturing environments. (\$1.5M)
- Evaluation of software technology to facilitate transition -- Evaluate system reengineering approaches that generate secure "wrappers" around legacy code to guarantee desired system properties. Demonstrate and distribute tools to support design of trustworthy systems by relating requirements, technology, and process descriptions. (\$6.0M)

- Trusted software and information warfare -- Establish intelligent incident response infrastructure that maintains awareness of current threats and solutions. Provide "immunization" of systems to attack (or other threats) by categorizing the root causes for network security flaws and developing mechanisms to correct these causes. Investigate technology for early analysis of system attributes pertaining to trust based on architectural descriptions of the system. Define and document administrative practices for operating a trustworthy network and distribute on interactive media. (\$12.1M)

(U) FY 1999 Program:

- Investigate/develop capabilities for rapid and inexpensive creation of Very High Level Languages (VHLLs) and code generators to attain breakthrough improvements in software productivity and quality. (\$3.0M)
- Develop and distribute methods and tools to support prediction of key system properties during system development and preservation during system evolution. (\$5.2M)
- Provide tools and techniques to enable rapid adaptation and reconfiguration of systems to ensure survivability in the face of attack. (\$3.0M)
- Define effective means for interoperation/integration of heterogeneous system components that are generated from architectural descriptions and account for differences in fidelity and semantics as well as protocols. (\$5.0M)
- Establish analysis and test infrastructure for assessing the survivability of software systems that include COTS products. (\$4.0M)

(U) Mission Description: This project develops the technology base underlying the solutions to protect DoD's mission-critical information systems against attack upon or through the supporting infrastructure. These technologies lead to generations of stronger protection, higher performance, and more cost-effective security solutions scalable to several thousand sites and to high performance computing technologies. Technologies developed under this project will be exploited in High Performance Computing (ST-19) and other defense programs to satisfy defense requirements for secure and survivable systems. This program is an expansion of investments in information security made previously in High Performance Computing.

(U) Information Survivability focuses on early prototypes of software and hardware technologies leading to scalable protection for large-scale, heterogeneous systems usable over a wide range of performance in diverse threat environments. High confidence networking technologies will be developed consisting of security mechanisms and value-added security services for integration into network technologies. High confidence computing systems will be developed that provide modular security services and mechanisms, provide high reliability for distributed computations, and allow geographically-separated parts of an organization to interact as if they shared a common security perimeter. This also includes secure and fault-tolerant operating systems, firewalls, and system management tools. Assurance and integration tools will aid the development of high assurance and trusted systems that add expression of modular system structures, networking, and other distributed-system protocols and the ability to reason about their security properties.

(U) Survivability technologies will be developed to mitigate national and defense computing infrastructure vulnerabilities that could be exploited by an information warfare enemy. Intrusion-detection systems will allow attacks on the defense infrastructure to be detected, the damage to be assessed, and appropriate response to be taken. Technologies will be developed to allow crisis-mode operation of critical infrastructure components. Robust networking protocols will be designed to facilitate continuous operations in hostile environments.

(U) **Mission Description:** This program element is budgeted in the Applied Research Budget Activity because it supports the advancement of concepts and technologies to enhance the next generation of tactical systems. The Tactical Technology program element funds a number of projects in the areas of Naval Warfare, Advanced Land Systems, Advanced Tactical, Aeronautics, and Advanced Logistics technologies.

(U) The Naval Warfare Technology project is focusing on: Simulation Based Design (SBD) and Command, Control, Communications and Intelligence/Synthetic Environments (C3I/SE). The Simulation Based Design program will provide the tools required to integrate cost, performance and manufacturing considerations throughout the design process. The SBD program is developing and demonstrating a prototype infrastructure that will enable a significant positive change in the acquisition process for large, complex warfighting systems utilizing virtual prototypes in synthetic environments. In the C3I/SE program, advanced information technologies are being integrated into advanced prototype systems to provide improved battlefield awareness and dominance to mobile command centers in the field.

APPROPRIATION/BUDGET ACTIVITY: RDT&E, Defensewide BA 2 Applied Research		P-1 ITEM NOMENCLATURE Tactical Technology, PE 0602702E	

Ship Systems Automation, a program to develop a highly integrated sensor, weapons control, and battle damage suite to reduce costly shipboard manning requirements, is budgeted to complete in FY 1997.

(U) The Advanced Land Systems Technology project continues efforts in Small Low-cost Interceptor Devices (SLID) and unexploded ordnance detection efforts; and initiates robotics for Urban Warfare, advanced Fire Support Systems and Virtual Strike Force deception systems. The SLID program will develop and test a system for providing protection against missiles and projectiles with explosive warheads. The unexploded ordnance program is developing tools such as enhanced sensors, communications upgrades, and new techniques to detect and neutralize mines and other ordnance for use in domestic situations, peacekeeping operations, and low intensity conflicts. Robotics for Urban Warfare will develop and demonstrate small, agile, unmanned systems for use in constrained urban environments. Advanced Fire Support Systems will develop and test advanced locomotion artillery platforms into the combat area commanded by ground forces to designated targets. The Virtual Strike Force will provide deception capabilities to draw enemy weapons off target and defeat surveillance sensors.

(U) The Advanced Tactical Technology project is exploring the application of compact lasers, microwave radiation, advanced displays and advanced mathematical algorithms to enhance the performance of radar, sensors, communications, and electronic warfare and target recognition systems. The technologies under development will improve infrared countermeasures, enable active infrared suppression, permit faster signal processing, improve target recognition, and create smaller, more capable microwave devices. Also included in this project is the Miniature Air-Launched Decoy ACTD.

(U) The Aeronautics Technology project will develop and demonstrate a new family of Micro-Aerial Vehicles. The Micro-Aerial Vehicle will be an order of magnitude smaller than any operational UAV and will be useful in a wide variety of military missions from covert imaging and chemical/biological agent detection to communication enhancement.

(U) Finally, the Advanced Logistics project will develop and demonstrate technologies that will make a fundamental difference in transportation and logistics planning and operations in the 21st Century. Developmental efforts will focus on transportation models and simulations and revolutionary changes to physical systems that impact intermodal system performance and efficiency.

PE 0602702E

COST (In Thousands)	FY 1996	FY 1997	FY 1998	FY 1999	FY 2000	FY 2001	FY 2002	FY 2003	Cost to Complete	Total Cost
Naval Warfare Technology TT-03	38,915	31,219	27,422	39,296	54,553	59,172	59,172	60,172	Continuing	Continuing

(U) Mission Description: The Naval Warfare Technology project develops advanced technologies for application to a broad range of naval requirements. The enabling technologies include: virtual prototyping and advanced modeling to radically change the DoD acquisition process through integrated product and process design; integrated ship sensor, weapons and platform technologies to demonstrate the feasibility of reduced ship manning; techniques that will reduce acquisition costs through greater reliance on commercially available electric drivers and components, and composite materials; and Command, Control, Communications, and Intelligence/Synthetic Environments (C3I/SE) for littoral warfare.

(U) The Simulation-Based Design (SBD) area is developing and demonstrating a prototype infrastructure that will enable a significant positive change in the acquisition process for large, complex warfighting systems. SBD will utilize virtual prototypes in synthetic environments to enable effective, integrated product and process development. The program will integrate the technologies of distributed interactive simulation, physics-based modeling, and virtual environments and apply them to the design, acquisition, and life cycle support processes of systems. Complete simulation from early in the concept formulation stage through verification of requirements to design, manufacture, operation, training, and logistics will be available prior to initiation of construction. Successful development and deployment of SBD will enable meeting the program's objective of reducing the cost and acquisition time for DoD systems. Overall product quality and capabilities will be enhanced by the timely insertion of the latest technological advances into designs as they progress through the shortened acquisition cycle. SBD will be applicable to a broad range of system domains including land vehicles, aircraft, satellites and marine vehicles. SBD will be applicable to all subsystems, from mechanical to large scale electronic, within an overall system and it will enable cost savings by reducing the need for expensive physical mockups and by eliminating many of the manufacturing inefficiencies caused by inadequate design.

(U) In the Ship Systems Automation (SSA) area, advanced, highly automated sensor, weapons control, and platform systems (including damage control) are being developed and demonstrated for submarine and surface ship applications. Through evolving sequential technology demonstrations, efforts in this area will show how an integrated collection of automated systems could achieve an order of magnitude reduction in crew size. Because personnel account for a significant portion of current ships' life cycle costs, such a reduction would lead to immediate and long term cost savings for ship acquisition programs. SSA technology developments include intelligent command-level advanced

reasoning components, scalable sensor integration work stations to fuse multi-source data and intelligently display the tactical scene on a situation assessment system, cooperating expert agents conducting mission-context/sensor employment planning, and integrated internal condition sensor and control systems to intelligently display and control ship physical conditions on a ship's internal assessment system.

(U) A new thrust is planned that will develop and demonstrate critical technologies that are focused toward the affordability of future ships. Candidates to be considered include extensive use of advanced electrical machinery and control systems to take advantage of Commercial-Off-the-Shelf (COTS) equipment, and electric drive for ship's propulsion. Other areas for consideration will include widespread use of composites and development of advanced coating systems for reduced maintenance.

(U) In the Command, Control, Communication, and Intelligence/Synthetic Environment (C3I/SE) area, advanced information technologies are being integrated and applied to provide improved battlefield awareness and battlefield dominance to mobile command centers in the field (e.g., Force Commanders. Commander Joint Task Force (CJTF), and deployed Joint Special Operations Task Force (JSOTF) Commanders). The advanced prototype systems developed under this program integrate the latest technologies in high-bandwidth communications, object oriented information system, collaborative planning, intelligent database access, image processing, data exploitation, and high performance computing to address the unique (quick reaction and real-time execution) requirements of forward deployed, mobile commanders. This program also will develop, demonstrate, and transition the tools and systems necessary to recognize, understand, forecast, and develop options to defuse potential crisis situations in hours by reducing the time to form teams, analyze crisis data, and develop and brief options for response. It also develops the Synthetic Test Range (STR), which in conjunction with the Simulation Based Design (SBD) development, is aimed at improving the acquisition process. The STR will conclude in FY 1996 and transition to Naval Sea Systems Command. The C3I/SE program builds upon existing DARPA-developed planning tools while identifying and incorporating other emerging C3I and information system technologies. Starting in FY 1996, the program is emphasizing collaborative crisis understanding and mitigation developing tools and systems necessary to recognize, understand, forecast, and defuse potential crisis situations. This effort will be focused on National Command Authority, National Security Council, and the National Military Command Center.

(U) Program Accomplishments and Plans:

(U) FY 1996 Accomplishments:

- Conducted Simulation-Based Design (SBD) prototype demonstrations on a complex ship application at distributed design and visualization centers linked via nationwide networks; the first, a joint

demonstration in support of the Defense Modeling and Simulation Office High Level Architecture, the second, a virtual prototype of a ship combat system using an electronic smart product model to demonstrate functional requirements. (\$9.9M)

- Initiated expansion of Simulation-Based Design (SBD) through application to development programs for small rapid satellite manufacturing, selected aircraft sub-system manufacturing, land vehicle power train design, and ship manufacturing enterprise. (\$4.9M)
- Conducted high fidelity radar simulation with an operational radar system, transitioned to Navy users. (\$1.8M)
- Initiated collaborative crisis understanding and mitigation effort, developed concept of operations and visualization demonstration emphasizing data mining, modeling and collaboration in response to pre-crisis indicators. (\$1.7M)
- Conducted demonstration and testing of campaign operations planning system applied to joint forces command and control in a deployable package. (\$3.9M)
- Demonstrated advanced Ship Systems Automation (SSA) technologies which enable a few operators to collaborate with advanced-reasoning systems to manage the construction of a combatant ship in that scene. Intelligent System Interface tactical scene and the effective operation of a combatant ship in that scene. (\$9.8M)
- Continued most promising ocean sciences efforts at the Center of Excellence for Research in Ocean Sciences (CEROS). Issued a Broad Agency Announcement and selected eleven innovative marine technology projects for initiation. (\$6.9M)

(U) FY 1997 Program:

- Conduct Interim Simulation-Based Design (SBD) prototype engineering demonstration tests of multi-disciplinary engineering analysis for an advanced maritime application. (\$8.9M)
- Initiate SBD prototype engineering tests of the smart product model in support of integrated life cycle requirements and analyses of an evolving maritime application. (\$2.2M)
- Commence deliveries and support of prototype and interim SBD software to DoD Service's beta sites for use, evaluation, and feedback. (\$3.3M)
- Demonstrate automated situation assessment and fusion of a complete multi-warfare tactical scene (air, surface, subsurface), tactical planning, and self-defense capabilities for ownership and associated commanding platforms. Also demonstrate advanced reasoning systems for platform monitoring and control, intelligent construction and presentation of platform status and planning, and automated damage control/recovery reasoning. (\$9.1M)

(U) **Mission Description:** This project is intended to develop technologies for contingency missions and military Operations-Other-Than-War (OOTW) to make U.S. combat forces more deployable, effective, survivable, and affordable. This project supports eight main efforts: OOTW and OOTW/Law Enforcement; Small Unit Operations (SUO); Small Low-Cost Interceptor Device (SLID); a Foreign Cooperative Demonstration; Robotics for Urban Warfare; Multimode Weapons for Future Combat Systems; Advanced Fire Support Systems; and Unexploded Ordnance Detection.

(U) OOTW encompasses a wide range of activities where military power is used for purposes other than large scale combat. The purpose of the DARPA OOTW research and development program is to develop and demonstrate technologies that will enhance the survivability of individual soldiers and military units engaged in OOTW. These technologies have application to both general military operations and civilian law enforcement. Technology developments are being conducted in areas such as personnel armor; limited effects technology; concealed weapons detection; and automatic language interpretation/translation. Funding for this program will be completed in FY 1996.

(U) The SUO program will develop the key technologies to enable more capable, dispersed military units to effectively perform warfighting operations traditionally accomplished with massed forces. The SUO program focuses on enabling comprehensive awareness at the tactical level in restrictive environments. Sniper/mortar detection and hyperspectral infrared mine detection work initiated under the OOTW program will be continued with an emphasis on small unit operations. In FY 1997, these SUO efforts were realigned into Project EE-51.

(U) The SLID program will develop and test a system for providing protection against missiles and projectiles with explosive warheads. This system will detect, track and intercept these threats at a standoff distance sufficient to render them ineffective. Applications for the SLID system include: self-defense of vehicles; high value fixed sites such as command centers, parked aircraft and radars; and may be extended to naval platforms and low-speed aircraft.

(U) The Foreign Cooperative Demonstration program will fabricate and demonstrate a new system for enhancing the survivability of armored vehicles based on technology developed by a foreign source.

APPROPRIATION/BUDGET ACTIVITY RDT&E, Defensewide BA 2 Applied Research	R-1 ITEM MONITORING Tactical Technology, PE 0602702E, Project TT-04		
<p>(U) The Robotics for Urban Warfare program will develop and demonstrate technology required for the operation of small, agile, extremely capable unmanned systems to support military forces in the highly constrained, unstructured environments characteristic of urban areas. The program will emphasize enhanced mobility through innovative locomotion and manipulation concepts and the development of an intelligent system architecture required for enhanced autonomy.</p> <p>(U) The Multimode Weapons for Future Combat Systems program will develop and test a single vehicle mounted weapon system capable of meeting multiple needs for a Future Combat System, including direct fire against armor, indirect fire with remote designation, and area denial by means of loitering munitions. The effort will include the development of the launch system, remote targeting capability, and prototype launch vehicles for each mission.</p> <p>(U) The Advanced Fire Support System program will develop and test systems to provide the rapid response and lethality associated with gun and missile artillery in packages which require significantly fewer personnel, require decreased logistical support, and have increased survivability compared to current systems. Two concepts are to be investigated: 1) the delivery of loitering platforms into the combat area by means of rockets, which can then be commanded to deliver submunitions to designated targets, and 2) an unmanned missile artillery package which can be delivered to the field by transport aircraft and commanded by ground forces.</p> <p>(U) The Unexploded Ordnance (UXO) Detection program will develop sensors for the chemically specific detection of explosives or other chemicals characteristic of land mines and/or shallowly buried UXOs. The sensors developed under this program will provide soldiers with the effectiveness of canine olfaction detection without the logistics and other constraints imposed by the use of live animals. These chemically specific sensors will work either singly or in conjunction with other technologies (such as the hyperspectral mine detector, developed under the Small Unit Operations program (SUO)) that exploit different physical features.</p> <p>(U) <u>Program Accomplishments and Plans:</u></p> <p>(U) FY 1996 Accomplishments:</p> <ul style="list-style-type: none"> • Operations-Other-Than-War (OOTW). (\$6.8M) <ul style="list-style-type: none"> - Completed the Soldier 911 demonstrations in Korea and Macedonia, and the Korean/English text translator. - Completed modular tag concept definition phase. - Continued mine/unexploded ordnance detection technology development, including chemically-specific detection techniques.

- Demonstrated the Korean/English speech translator, the concealed weapons system, extremity armor, and limited effects technology.
- Continued development of sniper, mortar, hyperspectral infrared mine, and thru-wall detection technologies with emphasis on small unit operations. (\$11.7M)
- Initiated Small Low-Cost Interceptor Device (SLID) phase II fabrication and testing effort with remaining contractors. Performed sub-system tests leading to static system tests. (\$13.2M)
- Initiated development of the system for the Foreign Cooperative Demonstration. (\$2.0M)

(U) FY 1997 Program:

- Continue SLID phase II effort. Conduct full system static tests and tests against slowly moving targets. Prepare for live-on-live tests. (\$12.1M)
- Complete the Foreign Cooperative Demonstration testing and transition program to the Army. (\$2.0M)
- Continue chemically-specific unexploded ordnance/mine detection technology development. Characterize explosive and other related chemical contamination at minefield. Evaluate advanced algorithms and sensor fusion capabilities for multiple-sensor detection. (\$8.0M)

(U) FY 1998 Program:

- Complete live-on-live Small Low-Cost Interceptor Device (SLID) testing. (\$7.0M)
- Field demonstration of laboratory scale system for chemically specific detection of land mines. (\$12.0M)
- Initiate development of advanced locomotion concept for small urban warfare robotic platforms and initiate definition and development of intelligent system architecture. (\$1.0M)

(U) FY 1999 Program:

- Extend SLID protection range and demonstrate application to high value fixed site. (\$7.0M)
- Perform concept development of multinode weapons, to include launch, designation, and munitions systems for both direct and indirect fire. (\$4.0M)
- Conduct analysis of advanced remote fire support systems to include investigation of loitering platforms and unmanned missile artillery package concepts. (\$5.0M)
- Field demonstration of prototype chemically specific land mine detector paired with other sensors as appropriate. (\$10.0M)
- Demonstrate navigation of small urban warfare robotic platforms in simplified urban environment. (\$4.0M)

(U) Mission Description: This project focuses on the technology and applications of: compact lasers, microwave radiation sources, advanced displays, and mathematical algorithms for signal and image processing and modeling and simulation of nonlinear processes to dramatically improve the performance of radar, sensors, and systems for electronic warfare, target recognition, and military communications. Seven broad technology areas are being investigated: (a) compact, efficient, frequency-agile, diode-pumped, solid-state lasers for infrared countermeasures, laser radar and sensors; (b) compact high density data storage for high bandwidth image processing; (c) high performance computational algorithms for signal processing, target recognition and tracking, electromagnetic propagation, and processing of advanced materials and microelectronics; (d) precision optics components for critical DoD applications; (e) passive infrared signature suppression to counter air-to-air missile threats; (f) tactical landing systems; and (g) miniature air-launched decoy systems.

(U) Program Accomplishments and Plans:

(U) FY 1996 Accomplishments:

- Compact Lasers. (\$7.3M)
 - Demonstrated compact lasers at mid-infrared wavelengths for infrared (IR) countermeasures.
 - Demonstrated mid-infrared lasers with 2 watts output power and a modulated pulse repetition frequency of 10 kilohertz, packaged in a compact configuration for field testing.
 - Demonstrated pulsed operation of quantum cascade diode lasers operating at mid-infrared wavelengths.
 - Demonstrated frequency conversion into mid-infrared wavelengths using periodically poled lithium niobate crystals.
- Holographic Data Storage (\$5.9M)
 - Performed technology demonstration to establish system trade-offs of various candidate materials for holographic data storage.
 - Demonstrated proof-of-principle digital holographic data storage devices to establish the capability of various multiplexing methods and error detection and correction schemes.
- Fast Computational Algorithms. (\$13.2M)
 - Demonstrated wavelet-based methods for automatic target detection and recognition.
 - Demonstrated multiresolution methods and adaptive waveforms for image formation and processing.
 - Developed hybrid automatic target recognition strategy for synthetic aperture radar exploiting most

advantageous features of both wavelets and nonlinear partial differential equation-based methods.

- Developed 3D implementation of fast multipole method for radar cross section calculations.
- Identified approaches to reducing high-order nonlinear descriptions of thin film processes to real-time sensing and control models.
- Precision Optics Technology. (\$3.1M)
- Developed requirements and performed initial calculations for conformal and off-axis optical components for next generation tactical systems.
- Advanced Infrared Signature Suppression. (\$.9M)
- Integrated and demonstrated (flight test) a long-wave infrared (LWIR) suppression system.
- Tactical Landing System (TLS). (\$6.2M)
- Fabricated and demonstrated a transportable TLS designed for minimal installation/calibration times; accuracy improved through the addition of phase measurement capability; integrity monitoring feature added to permit autonomous operation.
- Miniature Air-Launched Decoy. (\$.7M)
- Conducted engine independent validation and established system design.

(U) FY 1997 Program:

- Compact Lasers. (\$6.7M)
- Demonstrate breadboard systems of compact high power tunable mid-infrared lasers, and laser diodes operating at mid-infrared wavelengths.
- Demonstrate breadboard tunable mid-infrared lasers with 20 watt output power at 20 kilohertz (kHz) pulse repetition rate for ship defense.
- Demonstrate room temperature operation of continuous wave mid-infrared laser diodes.
- Demonstrate active tracking system at mid-infrared wavelengths.
- Holographic Data Storage. (\$4.9M)
- Technology demonstration to establish functional limits of holographic data storage.
- Demonstrate 1 terabit storage capacity for functional evaluation of write once and read many type storage systems.
- High Performance Algorithm Development. (\$14.7M)
- Demonstrate classification performance improvement for Longbow fire control radar achieved using a wavelet classifier.
- Apply adaptive waveform designs to radar and communication.
- Apply multiresolution methods to image processing and formation.
- Implement a hybrid automatic target recognition strategy for synthetic aperture radar exploiting most

advantageous features of wavelets and nonlinear partial differential equation-based methods.

- Select applications for development of wavelet-based detection, discrimination, and classification strategies.
- Begin development of new strategies for data, sensor, and algorithm fusion for signal and image processing applications that exploit the feature extraction capability of wavelets.
- Demonstrate orders-of-magnitude speed-up provided by parallel implementation of fast multipole techniques to radar cross section calculations.
- Develop methods for calculating electromagnetic scattering from objects in ground clutter.
- Advanced Mathematics for Microstructural Process Control. (\$9.5M)
 - Enhancement of strategies for physicochemical modeling of thin film vapor deposition processes that integrate process, sensing, and control considerations and provide understanding of critical microstructure issues needed to design high-quality and high yield manufacturing processes.
 - Develop fast algorithms for modeling and design of large-scale, high-performance circuits.
- Precision Optics Technology. (\$7.0M)
 - Continue development of conformal and off-axis optical components for tactical systems.
 - Develop magneto-rheological finishing for aspheres, toroids and cylinders.
 - Demonstrate design tools for conformal and off-axis optical systems.
- Miniature Air-Launched Decoy (MALD). (\$3.2M)
 - Continue MALD system design, engineering and producibility analysis. Begin system fabrication and qualification testing of subsystems and initiate Seek Eagle process.

(U) FY 1998 Program:

- Compact Lasers. (\$4.0M)
 - Demonstrate compact high power tunable lasers and laser diodes at mid-infrared wavelengths.
 - Develop breadboard tunable mid-infrared lasers for airborne infrared countermeasures.
 - Demonstrate room temperature long wavelength laser diodes in the 7-to-9 micrometer wavelength range.
- Holographic Data Storage. (\$1.0M)
 - Demonstrate 1 terabit storage capacity for functional evaluation of read/erase type storage systems.
- High Performance Algorithm Development. (\$13.5M)
 - Demonstrate hybrid automatic target recognition strategy for synthetic aperture radar exploiting most advantageous features of wavelets and nonlinear partial differential equation-based methods.
 - Develop application-specific wavelet-based automatic target recognition algorithms.
 - Develop new strategies for data, sensor, and algorithm fusion for signal and image processing applications that exploit feature extraction capability of wavelets.

- Develop prototype electromagnetic scattering models for objects in ground clutter.
- Demonstrate toolboxes for generating optimal portable Fast Fourier Transforms and wavelet algorithms and apply to high dimensional synthetic aperture radar.
- Develop mathematical approaches to developing optimal portable applications libraries for selected computational kernels required in signal processing and thin film process simulations.
- Advanced Mathematics for Microstructural Process Control. (\$11.6M)
 - Develop physicochemical models for thin film vapor deposition processes that integrate process, sensing, and control considerations and provide understanding of critical microstructure issues needed to design high-quality and high yield manufacturing processes.
 - Implement fast algorithms for modeling and design of large-scale, high-performance circuits.
 - Develop reduced physicochemical models and algorithms for real-time sensing and control of thin film vapor deposition processes.
- Precision Optics Technology. (\$14.5M)
 - Continue development of conformal optical system components for tactical systems.
 - Complete designs of conformal optics sensor systems for airborne platforms and missiles.
 - Fabricate aspheric optical components and diffractive optical elements on curved substrates.
 - Demonstrate metrology tools.
- Miniature Air-Launched Decoy (MALD). (\$19.2M)
 - System integration and flight demonstration; continue Seek Eagle process.

(U) FY 1999 Program:

- Compact Lasers. (\$5.8M)
 - Complete demonstration of compact high power tunable lasers and laser diodes at mid-infrared wavelengths.
 - Develop packaged tunable mid-infrared lasers for airborne infrared countermeasures.
 - Complete demonstration of laser diode arrays operating at mid-infrared wavelengths.
- High Performance Algorithm Development. (\$15.2M)
 - Demonstrate application-specific wavelet-based automatic target recognition algorithms.
 - Validate prototype electromagnetic scattering models for objects in ground clutter.
 - Develop data, sensor, and algorithm fusion algorithms for signal and image processing applications that exploit the feature extraction capability of wavelets.
 - Demonstrate fast algorithms for modeling and design of large-scale, high-performance circuits.
 - Develop prototype toolboxes for generating optimal portable applications libraries for selected computational kernels required in thin film process simulations.

(U) **Mission Description:** Aeronautics Technology efforts will address high payoff opportunities to dramatically reduce costs associated with advanced aeronautical systems or provide revolutionary new system capabilities for satisfying current and projected military mission requirements.

(U) A new family of Micro-Aerial Vehicles (MAVs) which are at least an order of magnitude smaller than current flying systems (less than 15 cm in any dimension) will be developed and demonstrated. The capability to accomplish unique military missions as diverse as covert imaging in constrained areas, biological-chemical agent detection and characterization, remote precision mines, and urban battlefield communications enhancement, will be stressed through an examination of a variety of vehicle concepts. The resulting capability should be especially beneficial in the emerging urban warfighting environment, characterized by its complex topologies, confined spaces and areas (often internal to buildings), and high civilian concentrations. The MAV program will focus on the technologies and components required to enable flight at these small scales, including flight control, propulsion and lightweight power, navigation and communications, building upon and exploiting numerous DARPA technology development efforts, including advanced communications and information systems, high performance computer technology, Microelectromechanical Systems (MEMS), advanced sensors, lightweight, efficient high density power sources, and advanced electronic packaging technologies.

(U) **Program Accomplishments and Plans:**(U) **FY 1996 Accomplishments:**

- Initiated assessments of operational scenarios, candidate MAV configurations, and critical component technologies. (\$1.0M)
- Conducted Advanced Combat Vehicle feasibility analyses and design trade studies. (\$1.0M)

(U) **FY 1997 Program:**

- Identify potential configurations for an unpowered boost/MAV. Complete assessment of operational scenarios, configurations and component technologies, and initiate design of powered and unpowered MAVs. Initiate development of critical technology components. (\$3.0M)

Advanced Logistics Technology TI-10	4,328*	19,154	25,738	27,665	10,633	10,000	0	0	0	N/A		

* The FY 1996 Advanced Logistics effort was partially funded under PE 0602301E, Project ST-11 (\$4.1M).

(U) **Mission Description:** The Advanced Logistics Technology Program will investigate and demonstrate technologies that will make a fundamental difference in transportation and logistics. The program will define, develop, and demonstrate fundamental enabling technologies that will permit logistics and transportation assets to be deployed, tracked, refurbished and redeployed more efficiently than ever before. Currently, these assets are being managed using isolated, independent, and sometimes incompatible computer systems. Therefore, the very rapid replanning and redirection necessary to support missions involving simultaneous local and major regional conflicts cannot be accomplished today. The Advanced Logistics Program will address these shortcomings and enable this significant capability to be developed. In addition, the project has enormous potential for cost savings through greatly improved management of transportation and logistics assets.

(U) Additionally, this program will develop multi-echelon, collaborative logistical/transportation support tools that will provide warfighters an unprecedented capability to monitor, rapidly replan and re-execute movement, even while enroute to the theater. The Advanced Logistics Program will focus on three areas: 1) Development of a computer network infrastructure that allows distributed real-time visualization and interaction with all phases, elements and components of the military and commercial transportation infrastructure; 2) Development of applications providing a technology environment that allows warfighters to rapidly understand and assess the logistics and transportation implications of a crisis situation, to generate effective plans and courses of action, to monitor a plan's execution, and to use that information to re-plan; and 3) Systems that will enable significant efficiency improvements in transportation and logistics, such as monitoring the condition of assets and the infrastructure, the creation of "plan sentinels" to serve as an early warning system for plan deviations, and improved theater distribution. The capabilities from these three areas will be integrated to demonstrate an end-to-end system solution.

(U) The Advanced Logistics Program supports joint initiatives with the Defense Logistics Agency and is coordinated with other related logistics efforts within the DoD. As technology matures, it will immediately transition to these initiatives which include the Defense Logistics Agency Logistics Research and Development (PE 0603712S) and the Joint Logistics Advanced Concept Technology Demonstration (PE 0603750D). The migration path for the end-to-end system

(U) Mission Description: This program element is budgeted in the Applied Research Budget Activity because it develops the technology and manufacturing capability for high definition displays and is important for virtually all DoD applications that involve visual and graphic information. Major components of this program include: projection, head mounted and direct view displays based on multiple technologies; development of equipment and components required to manufacture advanced display technologies, and prototype display systems for system evaluation. These efforts will establish a domestic technical capability and demonstrate the manufacturing capability of components necessary for military systems that capture, process, store, distribute and display high resolution images.

(U) Program Accomplishments and Plans:(U) FY 1996 Accomplishments:

- Continued development of flat panel and projection displays for mobile displays, and shipboard and landbased command and control centers. (\$19.3M)
- Continued development of equipment and components to meet display cost and performance goals. This included efforts in patterning, film deposition and annealing, and field emission display materials and assembly tools, as well as reflective liquid crystal materials and phosphor technology development. (\$17.1M)
- Developed system prototypes which leverage earlier developed display technologies and incorporated integrated systems and intelligent interfaces. (\$8.0M)

(U) FY 1997 Program:

- Initiate development of next generation reflective and emissive mobile display technologies and laser based projection systems for command and control applications. (\$13.0M)
- Continue development of equipment and components to meet display cost and performance goals. This will include efforts in field emission display materials, organic light emitting materials, reflective liquid crystal materials, phosphor technology development, and support for domestic display manufacturing infrastructure. (\$22.0M)
- Continue development of system prototypes which leverage earlier developed display technologies and incorporate integrated systems and intelligent interfaces. (\$10.0M)

COST (In Thousands)	FY 1996	FY 1997	FY 1998	FY 1999	FY 2000	FY 2001	FY 2002	FY 2003	Cost to Complete	Total Cost
Materials Processing Technology MPT-01	117,372	111,428	80,476	93,297	111,350	120,927	146,127	169,327	Continuing	Continuing

(U) Mission Description: Among the major goals of this project are to develop novel materials, materials processing techniques, and fabrication strategies for advanced structural and functional materials and components which will lower the cost, increase the performance and/or enable new missions for military platforms and systems. One important area of concentration is the exploitation of emerging processing approaches and mathematical models to tailor the properties and performance of structural materials and devices. Thrusts in this area include new concepts for lightweight personnel protection, mesoscale machines for miniature devices, and ultra lightweight materials for lowering the weight and increasing the performance of aircraft and spacecraft structures. Smart materials, sensors and actuators for the control of the aerodynamic and hydrodynamic behavior of military systems are being developed and demonstrated in order to increase performance and lower detectability of aircraft, helicopters and submarines. Another major thrust is the development of functional materials and devices and advanced magnetic materials for non-volatile, radiation hardened magnetic memories with very high density, short access time, infinite cycle ability and low power. New materials and concepts for increasing the availability of portable power to the soldier are also being investigated as are substitute protective coating materials which eliminate environmental hazards. Infrared Artificial Dielectrics (IRADs) will be a new class of infrared materials having an emissivity that can be fully engineered for different spectral bands. For example, it may be possible for IRADs to camouflage hot objects from passive infrared sensors operating in the common 8-to-12 micron band.

(U) Other areas of concentration seek to 1) develop bio-interface materials and methods for preventing pathogens from entering the warfighter's body, and 2) once in the body, prevent them from causing disease. Approaches include advanced biomaterial barriers and elimination techniques to prevent pathogen entry and augmenting the warfighter's immune response to pathogens.

(U) Program Accomplishments and Plans:

(U) FY 1996 Accomplishments:

- Structural Materials and Devices. (\$33.0M)
- Demonstrated full-scale rapid densification of carbon-carbon composite components.

BA 2 Applied Research

R-1 ITEM NOMENCLATURE

Materials and Electronics Technology,
PE 0602712E, Project MPT-01

- Developed magnetoresistive materials with improved electrical resistance properties.
- Developed simulation codes for the physics of vapor deposition and validated on industrial processes.
- Demonstrated a process to produce elastomeric electrorheological materials for acoustic wave filtering applications.
- Demonstrated large area, high deposition rate chemical vapor deposition (CVD) of diamond substrates.
- Identified processing approaches for manufacturing high thermal conductivity ($>10W/K-cm$), low-cost ($<\$1/carat$) diamond for thermal management of defense electronics.
- Initiated the demonstration of thermal management diamond in specific defense applications (e.g., high power transmit-receive modules, electronic warfare (EW) systems).
- Developed stable contacts for high temperature, high power semiconductors.
- Demonstrated high yield large area processing of thin film high temperature superconducting devices.
- Developed giant magneto resistive (GMR) films with enhanced electrical characteristics and enhanced magneto-resistance ratio at low magnetic fields for faster response and higher sensitivity of devices.
- A model magnetic memory cell design was completed.
- Energy and Environmental Sciences. (\$15.5M)
 - Designed and initiated construction of a hydrothermal oxidation system for shipboard excess hazardous material disposal.
 - Demonstrated more environmentally sound production processes for printed wiring boards.
 - Sensors and control models for the intelligent processing of materials were designed to improve the reliability of thermal barrier coatings for turbine engine airfoils and were demonstrated on a production scale reactor.
 - Initiated studies of advanced erosion/corrosion resistant thin film coatings.
 - Process parameters for the manufacture of copper-indium diselenide (CIS) photovoltaic solar cells were established and demonstrated in production scale efficiencies of over 8% (photons in to electrons out).
 - Bio Detection & Identification; BW Information Technologies; BW Immediate Response. (\$7.8M)
 - Developed integration technology to insert up-converting phosphors into existing biological warfare agent sensors.
 - Demonstrated feasibility of an aflatoxin biosensor.
 - Initiated design phase of microfabricated polymer bilayer air-fluid sampling inlet.
 - Initiated studies on performance characteristics of biological sensors in multiple environments.
 - Initiated research to identify, purify, and crystallize target enzymes for inhibition of spore germination.
 - Developed reference architecture for smart messages system.

- Functional Materials and Devices. (\$38.3M)
 - Complete development of a plasma/ion etch numerical simulation.
 - Demonstrate predictive capability of high-pressure, low-order, chemical vapor deposition models and demonstrate feedback control to a desired wafer state.
 - Demonstrate intelligent processing of large area chemical vapor deposition (CVD) of diamond with production costs of \$1/carat.
 - Demonstrate the advantages of thermal management diamond in the performance of defense electronic systems or subsystems.
 - Grow single crystal boules for three inch diameter silicon carbide semiconductor wafers by scaling up the reactor and developing larger seed crystals.
 - Demonstrate high temperature superconducting technology with greater than fifteen square inch format and greater than eighty percent yield.
 - Demonstrate large area deposition of giant magneto-resistive (GMR) materials.
 - Fully characterize spin transistor and other spin polarized transport devices for use in ultra-high density memory applications.
 - Demonstrate prototype GMR magnetic memory cell and spin transistor memory cell using magnetic multilayers.
 - Initiate effort to develop candidate polymers using advanced lithography techniques for infrared artificial dielectrics (IRADS).
- Energy and Environmental Sciences. (\$17.8M)
 - Demonstrate a hydrothermal oxidation pilot plant for the destruction of shipboard excess hazardous materials.
 - Demonstrate novel recycling/reclamation techniques for disposal of scrap polymer matrix composites.
 - Demonstrate intelligent processing of thermal barrier coatings yielding reliable coatings which increase turbine engine inlet temperatures by up to 200 degrees F, with a commensurate increase of 10-15% in thrust.
 - Develop advanced erosion/corrosion resistant thin film coatings for military applications.
 - Demonstrate high yield, pilot scale production (1.5 megawatt/year) of high efficiency (10%) copper-indium diselenide (CIS) solar cells on flexible substrates; test in a military environment.

(U) FY 1998 Program:

- Structural Materials and Devices. (\$30.1M)
 - Demonstrate low cost titanium and superalloy component fabrication processes.

(U) Mission Description: This project develops advanced electronic and optoelectronic devices, semiconductor process tools and methodologies, materials for optoelectronics, and infrared devices. Areas of emphasis include: high performance analog-to-digital converters (ADCs), military optical processors, novel optoelectronic devices and components, high temperature electronic devices and high power electronics. This microelectronics development project develops and demonstrates advanced microelectronics technology for DoD critical needs. Technologies developed in this project are performance driven and exceed commercial capabilities. This project includes a significant effort to develop advanced material and device technology beyond the classical scaling limits of silicon device technology.

(U) Program Accomplishments and Plans:(U) FY 1996 Accomplishments:

- Developed heterojunction bipolar transistor process, device, and design technologies for application in high-speed analog-to-digital converters, digital-to-analog converters, multiplexers, and demultiplexers. (\$7.2M)
- Delivered the first-generation of hardware and software for advanced image processing. (\$6.3M)
- Completed development of advanced electronic neural network technologies for target tracking and recognition applications. (\$6.5M)
- Developed critical materials, processes, and device technologies for .25µm silicon-on-insulator semiconductor fabrication. (\$8.5M)
- Developed optoelectronics technologies to enable cost-effective fabrication and integration of module subassemblies for digital optoelectronic processors, bus and backplanes, and serial/parallel input/outputs. (\$25.3M)
- Initiated efforts to design radio frequency photonic components for transmission of millimeter waves and microwaves. (\$.6M)

- Advanced Microelectronics Process and Integration Technology - Develop in-situ process sensors to optimize process end points and to provide real time manufacturing feedback control and model development. This will result in the optimized integration of extreme scaled device technology on atomic layer material. (\$10.5M)
- Optoelectronics - Demonstrate critical optical elements and emitter based smart pixel arrays for a high payoff 3-D based optoelectronic engine for military battlefield information systems which can significantly impact: reconfigurable switching, 2-D image decompression/compression, and high speed parallel memory access. (\$11.5M)
- Digital Radar - Continue efforts to develop advanced digital-based processor components based on high speed semiconductor technologies, such as heterojunction bipolar transistors. (\$10.0M)
- A/D Converters - Develop integrated CAD tool set for high speed designs and demonstrate high speed analog-to-digital prototype. (\$3.0M)

(U) FY 1999 Program:

- Advanced Microelectronics Materials and Device Technology - Develop novel material and process approaches to address quantum level noise immunity in circuits with extreme scaled devices. (\$20.8M)
- Advanced Microelectronics Materials and Device Technology - Develop low noise high speed clock distribution and packing techniques for Trillion Transistor cells. (\$18.8M)
- Advanced Microelectronics Process and Integration Technology - Demonstrate full flow process of extreme scaled device technology on atomic layer material at an integration level of a trillion transistors. (\$24.2M)
- Advanced Microelectronics Process and Integration Technology - Develop feedback process control systems which integrate design and manufacturing to decoupling manufacturing cost from production volumes. (\$12.4M)
- Optoelectronics - Verify capability of optoelectronic engine to outperform conventional electronic systems by factor of greater than X 100 for specific computation intensive military signal processing problems such as STAP (Space Time Adaptive Processing) eg: for acoustic/digital radar signatures processing. (\$8.5M)
- Digital Radar - Develop Advanced digital processor components. (\$10.0M)
- A/D Converters - Complete prototype demonstration. (\$1.0M)

(U) Mission Description: Thin film electromagnetic materials have reached a stage of development where specific applications can be identified in electronic devices and circuitry for military systems. Films are deposited and patterned to form electromagnetic components in ways that are similar to, and compatible with, the processes of conventional semiconductor manufacturing. Such electromagnetic components, as well as complementary metal oxide semiconductors (CMOS), work best at lower temperatures, so that cryogenic packaging generally will be required for highest performance. Thin-film high temperature superconducting (HTS) components packaged with cryogenic devices are being applied to radars, electronic warfare suites, and communications systems to enhance performance by more than an order of magnitude while reducing size and power requirements. Particular demonstrations include an upgraded ship-defense radar (SPQ-9B) with 100X greater detectability of missiles in littoral clutter, and a switchable filterbank with 24 individually tuned high-performance filters to suppress Electronic Warfare (EW) saturation in radar warning receivers. Highly dependable and inexpensive cryocoolers (including thermoelectric cryocoolers) are being developed for these applications, and new efforts will explore techniques to improve the performance of all solid state thermoelectric coolers as well as the overall cryogenic performance in applications ranging from communications to computing.

(U) Program Accomplishments and Plans:(U) FY 1996 Accomplishments:

- High Temperature Superconductors/Analog and Digital Applications (\$13.7M): In this final year of the HTS Program, components were evaluated for integration into military avionics.
 - Continued integration of 24-element filterbank with refrigerator for application to F-15 aircraft.
 - Evaluated cryo-radar with HTS stabilized oscillator (STALO), at the Naval Research Laboratory (NRL) Chesapeake Bay Facility.
 - Completed funding for Consortium for Superconducting Electronics.
 - Continued development of a high-performance 8x8 asynchronous transfer mode (ATM) cryogenic switch in a wide area network.
 - Developed simultaneously switchable and tunable high temperature superconducting (HTS) filters, preserving low insertion loss and high quality factors.
 - Examined applicability of 2nd generation HTS filters to interference reduction in communications sets, particularly SINGARS radios.

R-1 ITEM NOMENCLATURE

Materials and Electronics Technology,
PE 0602712E, Project MPT-06

- Developed a Broadband Waveform Generator incorporating high temperature superconducting (HTS) Josephson Junction array for advanced radar applications.
- Developed small HTS magnets for energy storage and mine countermeasures.
- Cryogenics Technologies. (\$15.3M)
- Developed small/inexpensive reliable cryocoolers.
- Developed electronic devices and components optimized for cooled operation.
- Developed applications demonstrations with integrated cryocoolers and temperature-optimized components.
- Initiated applications demonstrations for insertion into radar and Electronic Countermeasures
- Militarized several small low-cost cryocoolers for insertion into radar and Electronic Countermeasures (ECM) systems.
- Developed a miniaturized cryopackage for a High Stability Cryo-stabilized oscillator (STALO) for Airborne Radars.

(U) FY 1997 Program:

- Cryogenics Technologies. (\$9.8M)
- Continue fabrication of cryo-radar, using HTS components and upgraded conventional components such as driver and active array, for final demonstration in FY 1998 with a simulated Naval scenario.
- Upgrade HTS switchable filter sets with tunable filters, for simpler construction and operation in aircraft Electronic Countermeasures (ECM) suites.
- Evaluate results of cryo-crossbar switch and asynchronous transfer mode (ATM) efforts. Determine most appropriate insertion for digital systems employing HTS devices as well as cryo-complementary metal oxide semiconductors (CMOS).
- Determine most important communications applications for cryo-components.
- Evaluate advanced thermoelectric materials with significantly improved figure of merit including quantum well and multilayer structures.

(U) FY 1998 Program:

- Cryogenics Technologies. (\$9.2M)
- Demonstrate, at an appropriate facility, a fully functional Cryo-Radar, with 108 dB dynamic range, 20 dB greater than present performance, showing capability to detect targets over that range and an ability to address the defense of surface ships to attacking missiles.
- Demonstrate the ability of cryo-filterbanks to provide Electronic Counter-Countermeasures (ECCM) for aircraft receivers, in a scenario to be developed by the Air Force.
- Demonstrate an improved analog to digital (A/D) converter employing cryogenic components.

- Demonstrate low-cost (less than \$2500), highly reliable (greater than 30,000 hr) Sterling cycle cryocooler that delivers 5 watts at 80K with less than 200 watts of total power.
- Thermoelectric Materials and Devices. (\$4.0M)
- Demonstrate new thermoelectric coolers using novel new materials that will provide a reduction in temperature greater than 50°C for a single stage.

(U) FY 1999 Program:

- Cryogenics Technologies. (\$8.2M)
 - Insert cryogenic packages in communication transceivers which mitigate electromagnetic interference effects.
- Demonstrate digital waveform generation and signal processing using superconducting quantum devices.
- Demonstrate pulse tube or Sterling cycle cryocooler costing less than \$1,500 in quantities of 1,000 with greater than 40,000 hr mean time before failure that delivers 5 watts of cooling at 70K with an input power of 150 watts or less.
- Thermoelectric Materials and Devices. (\$5.0M)
 - Demonstrate thermoelectric coolers that can achieve 100°C cooling in less than three stages as compared to the current seven stages.
 - Demonstrate potential benefit of efficient power generation from thermoelectric devices operating at high temperature (>500°C).

(U) Program Change Summary: (In Millions)

	FY 1996	FY 1997	FY 1998	FY 1999
President's Budget	12.0	9.8	11.2	10.2
Appropriated	30.9	N/A	N/A	N/A
Current Budget	29.0	9.8	13.2	13.2

(U) Change Summary Explanation:

FY 1996 Decrease reflects minor repricing.
FY 1998-99 Increases reflect expansion of cryocooler effort to include advanced thermoelectric materials.

COST (In Thousands)	FY 1996	FY 1997	FY 1998	FY 1999	FY 2000	FY 2001	FY 2002	FY 2003	Cost to Complete	Total Cost
Military Medical/Trauma Care Technology MPT-07	27,633	26,672	26,714	37,686	54,407	55,500	59,500	58,500	Continuing	Continuing

(U) **Mission Description:** The objective of this project is to revolutionize far-forward battlefield trauma care. The project recognizes that planned downsizing of U.S. forces creates new pressures to ensure force readiness, skill mix, and effective joint doctrine at a time when battlefield casualties carry both strategic importance and tactical relevance. A review of combat casualty care has shown: (1) that 90% of combat deaths occur in the zone of close combat prior to medical or surgical intervention; (2) that fratricide continues at casualty rates as high as 20%-30%; (3) that casualty location is a continuing battlefield problem; and (4) that less than 5% of U.S. Army active-duty physicians have treated combat casualties.

(U) The DARPA Combat Casualty Care program has two major segments: (1) Advanced Biomedical Technology and (2) Healthcare Information Infrastructure. The first segment exploits DARPA's unique leadership role in the electronics and information sciences to project advanced medical and surgical care into the far-forward battlefield area to effect early, successful, clinical intervention. In one thrust, this program will develop lightweight personnel status monitors (PSMs) permitting remote non-invasive clinical diagnosis, casualty localization, and friend or foe identification. The PSM, which would be worn by all soldiers as part of their combat uniforms, is further augmented with low power, secure, wireless communications and a Global Positioning Satellite system (GPS). The PSM would monitor the soldiers' clinical vital signs continuously, but would remain otherwise passive unless either queried by an operational commander or the soldiers' vital signs departed from established clinical norms.

(U) In a second thrust, this program will develop the technology base for early far-forward medical/surgical intervention. Hemorrhage will be controlled by projecting the expertise of a surgeon with remote telepresence surgery. To preserve critical organ system function, reverse systemic shock, and prevent hypoxia there will be development of automatically controlled devices to provide immediate mechanical or pharmacologic therapy. Once pharmacologic or early surgical stabilization has been achieved, the patient will be evacuated in a critical care life support for trauma and transport pod (LSTAT) which will function like an autonomous single-patient hospital intensive care unit.

APPROPRIATION/BUDGET ACTIVITY RDT&E, Defensewide BA 2 Applied Research		R-1 ITEM MONUMENTATURE Materials & Electronics Technology, PE 0602712E, Project MPT-07	
<p>(U) In a third thrust, workers will develop and exploit advanced simulation technology to improve the training of battlefield health care providers and to ensure skill currency. The objectives of this effort are to provide for the virtual representation of human structure and function; ensure near-seamless transition from training to clinical practice; and to permit simulation of combat-casualty medical care within the framework of operational battlefield requirements. The broader impact of whole-body virtual simulation on undergraduate and continuing medical education programs will allow military medical students to integrate traditionally separate academic disciplines and dramatically reduce the need for human cadavers or live animal wounding. Virtual prototyping is provided for medical environments such as mobile operating rooms, critical care life support for trauma and transport pod (LSTAT) and instruments/equipment inserted by casualty care simulations. New technologies for presenting information and training scenarios will be developed using human interface technologies.</p> <p>(U) A fourth thrust will develop high-fidelity diagnostic imaging, particularly in biomedical applications of Computed Tomography (CT), ultrasound, infrared (IR), and conventional X-rays. For example the particular problem that is encountered in ultrasound imaging is that the medium (i.e., human) tissue is inhomogeneous and scatters the signal, which blurs the image. The processes for developing high-resolution imaging will build upon the emerging technology of adaptive acoustics, the displays of which are intuitive and easily interpreted by the combat medic and physician.</p> <p>(U) In the other segment of the Combat Casualty Care program, the development of an advanced healthcare information infrastructure supports the entire trauma care technology base. Medical information must flow seamlessly and transparently on all levels of patient care. For this to occur, a platform-independent medical record system, such as the electronic theater medical record (ETMR), will ensure immediate continuity, distribution, and accessibility of medical information from the forward battlefield to the rear echelon support in U.S. based medical centers. This information will be achieved in multimedia heterogeneous databases of laboratory studies, radiologic and pathologic images, inpatient medical records, and be available over a world wide telecommunication system for real-time interactive collaboration among physicians. In addition, the infrastructure will provide a clinical associate system which is an intelligent system that assists physicians, nurses, corpsmen and paramedics in assessing and treating patients.</p> <p>(U) This work does not duplicate any efforts of the Military Services or the National Institutes of Health. A Memorandum of Agreement exists between the Army Medical Department and DARPA.</p>

(U) Program Accomplishments and Plans:

(U) FY 1996 Accomplishments:

- Advanced Biomedical Technology. (\$16.3M)
 - Developed a specialty version of the Personnel Status Monitor (Ranger Overwatch PSM) with temperature, heart rate and motion sensors for insertion into Ranger training exercises.
 - Completed first prototype limb trauma simulator and delivered to U.S. Army Special Operations Command (USASOC) Medical Training facility.
 - Completed design and feasibility study to incorporate trauma simulator into the medic training on the virtual battlefield at the Dismounted Warrior Battle Lab (DWBL).
 - Completed 7 degrees of freedom (DOF) end-effectors and wireless communication packages for Remote Telepresence Surgery System.
 - Completed and delivered first prototype of life support for trauma and transport (LSTAT) (one for each service).
- 3-D Ultrasound Technologies. (\$2.8M)
 - Developed test and evaluation battlefield/trauma ultrasonic imaging technology (using a 2D array equivalent) for 3D interpretation of body structures for insertion into Bosnia as a battlefield tele-ultrasound unit.
 - Continued development of Synthetic Aperture Radar processing techniques to determine those features which are pertinent to the ultrasonic imaging problem. Began testing algorithms which could mitigate the contribution of multiple scattering sites to image degradation.
- Healthcare Information Infrastructure. (\$6.2M)
 - Integrated models of combat doctrine and knowledge-based decision support tools (combat casualty protocols and guidelines) in support of combat medics and physicians.
 - Demonstrated hands-free capture of patient data under battlefield conditions.
 - Demonstrated integration of battlefield electronic patient record with peacetime care systems.
- Bio Detection and Identification. (\$2.3M)
 - Initiated characterization of immune response to sonicate inoculation in bacterial, viral and bio-engineered threat species.
 - Continued development of ionization source and curved-field reflection for tiny mass spectrometer.
 - Preliminary exploration of approaches to transect and characterize the induced genetic changes in stem cells or their derivative lineages for the purpose of potential defense against biological weapons.

(U) Mission Description: This program element funds high-risk projects that support revolutionary new approaches to biological warfare defense. Today, there is a tremendous mismatch between the magnitude of the biological warfare threat faced by the DoD worldwide, and its ability to adequately respond. The widespread availability of bacterial, viral and toxin stocks, minimal developmental cost and scientific expertise required, and abundance of unsophisticated weaponization potentials comprise a sinister threat. The single largest concern, however, is from the exploitation of modern genetic engineering by adversaries to synthesize "super pathogens". Dramatic recent developments in biotechnology, which this program will leverage, promise to eliminate this mismatch.

(U) Efforts include developing barriers to block entry of pathogens into the human body, therapeutics to stop pathogen virulence and to modulate host immune response, medical diagnostics for the most virulent pathogens and their molecular mechanisms, and biological and chemically-specific detectors. Program development strategies will include collaborations with the pharmaceutical, biotechnology, government, and academic centers of excellence. The program has received approval as a stand alone effort in the FY 1996 DoD Authorization Act and this program element leverages activities previously funded in PE 0602712E, Project MPT-01 in FY 1996.

(U) Program Accomplishments and Plans:

(U) FY 1996 Accomplishments: N/A

(U) FY 1997 Program: N/A

(U) FY 1998 Program:

- Pathogen Countermeasures. (\$32.3M)
 - Optimize the detection of specific pathogens by stem cells (in cell culture).
 - Determine the impact of modified red blood cells on coagulation and immune systems.
 - Define animal models in which to test the efficacy of modified red blood cells to defend against pathogen.
 - Establish a portfolio of strategies to:
 - * inhibit the expression of disease-causing (virulence) factors by pathogens.

<p>(U) <u>Mission Description:</u> This program element is budgeted in the Advanced Technology Development Budget Activity because its purpose is to demonstrate and evaluate advanced research and development concepts. Funding for fifteen projects are requested in FY 1998 within this program element such as Command and Control Information Systems, Information Integration, Small Unit Operations, and Global Grid Communications projects. A number of advanced concept technology demonstrations are funded within these activities. A discussion of the most significant projects follows.</p>

<p>(U) The Command and Control Information Systems project is developing the technologies necessary to facilitate joint campaign planning and control throughout the battlespace. The primary program in this project is the Joint Forces Air Component Command System, that will improve air combat coordination and targeting from initial planning through Air Task orders.</p> <p>(U) A new project, Aerospace Surveillance Technologies, will pursue non-traditional approaches to surveillance ranging from digital terrain mapping to passive radar tagging.</p> <p>(U) Advanced Simulation efforts will provide a distributed, scalable seamless warfighting environment at the weapon level of detail that will ultimately provide a massive synthetic theater of war capable of supporting such requirements as readiness training, doctrine refinement, requirements analysis, battle management simulation, and contingency planning. Communications and data infrastructures, range instrumentation and computer image generation are just a few of the developmental activities funded in the Advanced Simulation project. Funding for the Synthetic Theater of War ACTD is also included in this project.</p> <p>(U) The Global Grid Communications project will develop and demonstrate advanced communications technologies needed for defense and intelligence operations for the 21st century. The ultimate goal is deployment of a gigabit network that will be interoperable with commercial, optical and secure wireless networks.</p> <p>(U) The Advanced Ship-Sensor Systems project develops and demonstrates advancements in a wide range of technologies used in ship sensor, signal processing mechanical systems and advanced maritime platforms to significantly enhance the capabilities of naval and maritime forces.</p> <p>(U) The Sensor and Exploitation Systems programs (EE-50) are addressing imagery data collection processing capabilities by developing a Semi-Automated Imagery Processing advanced concept technology demonstration to enhance battlefield situational awareness, as well as developing sensor assets and evaluating the exploitation of sensor products.</p>

<p>(U) Four projects initiated in FY 1997 continue in FY 1998: 1) Fast Ship/Future Ship (EE-47) is a joint project with the Navy to develop the Arsenal Ship to enhance naval battle support; 2) Combat Hybrid Power Systems (EE-48) efforts will develop electric power management and control technologies for use in hybrid electric/diesel powered combat and scout vehicles; 3) Small Unit Operations (EE-51) will explore and develop the technologies to expand the capability of squad-level warfighters to control large battlespaces, remotely engage enemy targets, and operate across a wide spectrum of conflict situations; and 4) Information Integration Systems (EE-53) will develop enhanced means to evaluate and compress the massive data streams provided by modern surveillance systems so that the information required by battlefield combatants is available on a near real time basis.</p> <p>(U) Finally, this program element also includes efforts in advanced Guidance/Targeting technologies and the Defense Simulation Internet. FY 1998 marks the final year of funding for the Tier III Minus UAV program.</p>

Command Control Information Systems EE-21											
<p>(U) <u>Mission Description:</u> Recent military operations, e.g., Desert Storm and Haiti, demonstrated that current theater command, control, communications, intelligence/information systems, planning and rehearsal systems, and non-lethal weapons capabilities lack the ability to support effective operations in diverse new arenas and scenarios ranging from desert heavy battle to urban areas with large civilian populations. Current capabilities do not provide critical interoperable wide-area communications and fail to provide real-time situational awareness, decentralized battle planning, rehearsal and execution capability, and flexible interfaces. The goals of the programs in this project, described individually below, are to enhance information processing, dissemination and presentation capabilities by inclusion of information concerning enemy and friendly forces, providing a joint situational awareness picture and improved planning and execution support capability (through the Joint Forces Air Component Commander (JFACC) Initiatives, Advanced Cooperative Collection Management (ACCM) Program, Battlefield Awareness and Data Dissemination (BADD) Advanced Concept Technology Demonstration (ACTD) and the Advanced Joint Planning (AJP) ACTD; and providing multi-media information interfaces to on-the-move users (through the Speakeasy program). Integration of collection management, planning and battlefield awareness programs is an important element of our strategy for achieving battlefield dominance through information systems.</p> <p>(U) The Joint Forces Air Component Commander (JFACC) Program seeks to revolutionize command and control (C2) of joint and coalition air forces through the incremental development, integration, evaluation, demonstration and transition of technology and systems which will enable new operational concepts for planning and execution that will significantly improve the responsiveness, efficiency and effectiveness of air operations. Key aspects of the program are: continuous near-real-time planning and execution with all tasks tied to a central strategy; collaboration among distributed elements to achieve a high degree of integration through the echelons and across operations, intelligence and logistics; and end-to-end management of C2 operations including advanced capabilities for strategy development, target systems analysis, campaign assessment and resource planning. Key technologies include: Centrally managed, multi-stage, concurrent plan generation; planning agents; intelligent resource scheduling techniques; dynamic resource reallocation algorithms; adaptive cueing tools; automated information routers; information tailoring and visualization tools and advanced collaborative and workflow management tools. These technologies will be applied to requirements that include:</p>

BA 3 Advanced Technology Development

R-1 ITEM NCNENCLATURE

Experimental Evaluation of Major
Innovative Technologies,
PE 0603226E, Project EE-21

Continuous mission planning processes which quickly anticipate and react to changes in threat situation, resource availability and synchronization needs; full integration of intelligence and operational activities to support strike operations and prioritized target nomination; empowerment of cross functional product teams to quickly respond to changes; and proper battlefield knowledge to support activities and decisions at multiple echelons. JFACC technologies will be extended to maritime and land component C2 systems supporting joint force operations and associated planning tools will be made interoperable with related DARPA and Service programs (e.g. Advanced Logistics, Advanced Cooperative Collection Management (ACCM) and Battlefield Awareness and Data Dissemination). Program execution features a multi-phased, develop-demonstrate-transition approach, including close coordination with the Air Force and the Theater Battle Management Core Systems (TBMCS) development program which will serve as a near term precursor to the more revolutionary JFACC program.

(U) With the growing dependence on information systems and the pressing need to be able to get the right information to the right person at the right time, it becomes critical to protect information and assure the availability of associated services -- particularly in a stressed environment. The Information Assurance program will build on the initial work of the JFACC program to provide: Advanced capabilities for protection of information and services; a more robust information architecture; and automated tools for management and restoral of information service. This program will provide a set of common products, tools and architectural solutions that can be integrated for use by all DARPA programs as they proceed with their development.

(U) A new generation of collection systems will provide dramatically increased volumes of higher fidelity data to the operational decision maker. The challenge will be to dynamically manage and synchronize this advanced collection architecture with the processing, exploitation, and dissemination capabilities to provide the critical information to the decision maker in the constantly changing operational situation. The conventional requirements management, tasking, collection, processing, and exploitation process is unable to support the dynamics of a constantly changing operational environment. The Advanced Cooperative Collection Management (ACCM) Program will expand on efforts begun under the JFACC program and develop Continuous Asset Planning, Automatic Tasking, and Multi-asset Synchronization capabilities which will provide the collection management tools required to dynamically optimize/synchronize, schedule, and task the spaceborne, airborne and ground based collection, processing, exploitation and dissemination architecture. Collection Management (CM)-Link will optimize the architecture's capability to effectively support multiple operational users simultaneously by provided all echelons:

UNCLASSIFIED

RDT&E BUDGET ITEM JUSTIFICATION SHEET (R-2 Exhibit)		DATE September 1996
<p>APPROPRIATION/BUDGET ACTIVITY RDT&E, Defensewide BA 3 Advanced Technology Development</p>	<p>R-1 ITEM NOMENCLATURE Experimental Evaluation of Major Innovative Technologies, PE 0603226E, Project EE-21</p>	
<p>A common NRT view of the collection environment; current status of collection, processing, exploitation, and dissemination operations; faster than real-time simulations in support of trade-off decisions; and the ability to conduct real-time multi-echelon coordination and shared decision making. ACCM is coordinating closely with the DIA Collection Management ACTD which will be a recipient of DARPA technology as it matures.</p> <p>(U) The objective of the Battlefield Awareness and Data Dissemination (BADD) Advanced Concept Technology Demonstration (ACTD) is to deliver a synchronized, consistent description of the battlespace, allowing the field commander to design or adapt his command and control system to mission needs for effective application of force. The description of the battlespace provided to the warfighters under this ACTD will be tailored to their mission needs by intelligent selection of information to be broadcast and intelligent request (pull) and filtering at the warfighter workstation so that needed information is available. The ACTD focuses on the dissemination of the data required to present a consistent description of the battlespace and will provide the required infrastructure, information management capabilities, user applications and interfaces to intelligently manipulate data products, apply commercial direct broadcast technology for wide-band, low-cost dissemination of multi-media information and provide tactical internet services for two-way communications. A set of applications will be included in the ACTD to support the warfighter in the extraction of information about threats and other important aspects of the battlespace from nearby and remote real-time sensor data streams, intelligence sources and stored databases. BADD will be evaluated through participation in exercises, demonstrations and ongoing pilot services, and applications will be extended to other CINC users in addition to the CINC-sponsor of the ACTD, Atlantic Command.</p> <p>(U) Emerging technologies in Command and Control promise significant enhancements in operational readiness, planning and crisis response. The Advanced Joint Planning (AJP) ACTD seeks to evolve selected advanced planning tools, in a distributed collaborative environment at US Atlantic Command (USACOM), to evaluate the potential for enhancing Battle Staff Command and Control capabilities. Based on the evaluation results of this selected subset of planning tools, a full set of tools will be integrated into the USACOM Battle Staff Planning System. This "leave behind" system will form the model for upgrades to other CINC's Planning Systems.</p> <p>(U) Pacific Disaster Center (PDC) will help reduce the impact of various disasters by uniting Federal, State and local disaster agencies, utilizing the world's most advanced remote-sensing resources to reduce the loss of life and property from hurricanes, typhoons, volcanic eruptions, earthquakes, tsunamis and other disasters occurring in that area.</p>

APPROPRIATION/BUDGET ACTIVITY RDT&E, Defensewide BA 3 Advanced Technology Development		R-1 ITEM NOMENCLATURE Experimental Evaluation of Major Innovative Technologies, PE 0603226E, Project EE-21	
<p>This will be done by bringing timely, critical information directly to Federal, State and local agencies responsible for disaster management. The PDC will provide a prototype for continuous, 24 hour monitoring for near real-time warnings of disasters and will obtain data and produce data products as events develop, to assess severity and guide emergency response and civil relief efforts.</p> <p>(U) Speakeasy will demonstrate a software-programmable communication system in a tactical environment. Speakeasy, which operates over the 2 Mhz to 2 Ghz band, provides the capability to implement wireless communications concepts to meet service requirements. Speakeasy is an open architecture-based, software-programmable communications terminal supporting simultaneous operation on a minimum of six radio frequency waveforms (four programmable channels in addition to ones for the global positioning system and cellular). The program is transitioning to the Services in FY 1998 after an operational demonstration of the system during the Task Force XXI exercise in FY 1997.</p> <p>(U) The Small Satellites Program will explore advanced satellite architectures to satisfy direct tactical-battlefield surveillance needs. Innovative commercial technology and standards will be employed in a search for low-cost solutions to this important problem. This study will investigate various levels of satellite complexity to understand the functional relationship between system cost and the number of satellites in a constellation. Subsystems such as attitude control, prime power, on-board processing, and data storage will be tailored or eliminated to reduce satellite weight and cost while maintaining acceptable performance. Options such as direct-to-theater downlinking will be examined for their ability to address the tactical surveillance problem while reducing costs compared to current systems and concepts.</p> <p>(U) <u>Program Accomplishments and Plans:</u></p> <p>(U) <u>FY 1996 Accomplishments:</u></p> <ul style="list-style-type: none"> Continued development, test and integration of components of the LAC that were applicable to joint air campaign planning to the JFACC Program (EE-21) and transitioned them into that project. Delivered and transitioned UNIX version of Army Deep Operations System to Army and Marines. Continued development of advanced capabilities, with emphasis on interoperability, for incorporation into new and existing Air Force systems. Enhanced distributed situation object technology and targeting functions to support multimedia databases and target systems analysis. (This program was funded in Project EE-40 in FY 1996.)

<p>September 1996</p>		
<p>• Battlefield Awareness and Data Dissemination (BADD) ACTD: Demonstrated an initial capability that includes Warfighter Associate functions with local databases, filtering on tags, profiles, requests, static/dynamic visualization and video interaction; and Information Dissemination Manager functions with repository, object tagging, and video/data broadcast. Phase II of the program was initiated. BADD is also funded in part under EE-40 (Critical Mobile Targets-Warbreaker) in FY 1996 and the ACTD under Atlantic Command sponsorship will be consolidated into EE-53 (Information Integration Systems) in FY 1997. (\$7.1M)</p> <p>• Advanced Joint Planning (AJP) ACTD: Evaluated metrics of installed planning tools. Based on the results from previously installed planning tools, integrated and demonstrated additional planning tools which resulted in a completed integration of planning tools at United States Atlantic Command (USACOM). Expanded the functionality of systems to crisis response employing map based planning; and evaluated the installed planning tools and associated metrics under operational conditions for future design incorporation. Developed integration and test environment for evaluation of operational effectiveness of commander's planning tools. (\$17.0M)</p> <p>• Demonstration of interoperability between off-island military resources and island civil forces in response to a hurricane threat. (\$5.9M)</p> <p>• Speakeasy: Continued the development of advanced technologies for the Speakeasy multiband, multimode modules in preparation for first incremental capability demonstration in December 1996. This capability was utilized in the Task Force XXI Advanced Warfighting Experiment (AWE) by the 1st Brigade 4th Infantry Division. (\$9.0M)</p> <p>• Strategic Packaging for Single Chip Modules and MCMs developed revolutionary new low cost packaging technology for high pin-count chips and multi-chip modules. (\$1.9M)</p> <p>• Small Satellites (Congressional addition to the FY 1996 President's Budget): Initiated satellite architecture requirements study exploiting commercial satellite buses, low-cost radar designs and low-cost space launch vehicles. (\$1.0M)</p> <p>(U) <u>FY 1997 Program:</u></p> <p>• Joint Forces Air Component Commander (JFACC): Demonstrate prototype components of the continuous planning process: Air operations resource allocation and scheduling tools, campaign assessment process, workflow management control of the planning process, ISR and logistics planner, target system analysis toolset with advanced security and management features to assure necessary supporting information services in a stressed operational environment. (\$24.6M)</p>

<ul style="list-style-type: none"> • Battlefield Awareness and Data Dissemination (BADD): Provide enhanced information management and command and control information system capabilities to the Joint Broadcast System installed for European Command. The BADD ACTD, under the sponsorship of Atlantic Command, was funded in under EE-40 (Critical Mobile Targets-Warbreaker) in FY 1996 and is funded under EE-53 (Information Integration Systems) in FY 1997 and beyond. (\$5.0M) • Advanced Joint Planning ACTD: Based on prior year evaluation, complete the design, accomplish modifications and installation of a "leave behind" operational system, which can then be replicated for other CINCs. (\$14.5M) • Speakeasy: Continue development of hardware and software technology for the Speakeasy demonstration radio and participate in Task Force XXI AWE. Transition program to the Services to complete development in FY 1998 and FY 1999. (\$5.8M) <p>(U) FY 1998 Program:</p> <ul style="list-style-type: none"> • JFACC: Demonstrate and evaluate the basic technology/application building blocks and system architecture for the "JFACC After Next" Concept (Phase 2). Develop Phase 3 capabilities - an initial integrated campaign management and continuous planning and execution ability. Develop the combined benefit of target systems analysis and campaign assessment leading to an increase in mission cost effectiveness by a factor of three. Develop initial transition of JFACC capabilities to maritime environment and demonstrate interoperability with TBM Core Systems and the DII. (\$37.2M). • Information Assurance: Demonstrate automated capabilities to identify and prioritize near-term mechanisms and strategies for resilient boundary protection, access control and integrity safeguards in systems and networks. (\$5.0M) • Expand the Advanced Cooperative Collection Management (ACCM) functionality beyond the JFACC ISR Planner to include information needs management and dynamic, multi-asset allocation. Begin technology transitions into DoD collection management migration systems. Demonstrate emerging ACCM functionality with Service transition partners and integrate fully with the DIA ACTD on Collection Management. (\$10.6M) • Battlefield Awareness and Data Dissemination (BADD): Complete enhanced information management and command and control information system upgrades to the Joint Broadcast System installed for European Command and transition operations to DISA. (\$6.0M) • Complete the transition and support to the operational Advanced Joint Planning System to USACOM. (\$2.4M)

COST (In Thousands)	FY 1996	FY 1997	FY 1998	FY 1999	FY 2000	FY 2001	FY 2002	FY 2003	Cost to Complete	Total Cost
Aerospace Surveillance Technology EE-27	3,000	0*	24,900	26,800	18,100	11,000	6,000	27,000	Continuing	Continuing

* Tagging concepts and elements of the sensor/sensor processing capabilities (hyperspectral detection and tactical synthetic aperture radar) matured under small unit operations (EE-51) will be used in the conceptual design and analysis of the programs listed under this project.

(U) **Mission Description:** This project funds space and airborne sensor efforts whose purpose is to improve the accuracy and timeliness of our surveillance systems for improved battlefield awareness. Timely surveillance of enemy territory under all weather conditions is critical to providing our forces the tactical information needed to succeed in future wars. This operational surveillance capability must perform during enemy efforts to deny and deceive the sensor systems, and operate, at times, in a covert manner. This project will exploit recent advances in signal processing, large constellation satellite architectures, low-power high-performance computing, and low-cost micro-electronics to develop advanced surveillance systems.

(U) The Tactical Radar Program will develop technologies to meet the stressing needs associated with mobile target detection; i.e. one meter or better resolution with a revisit time of order ten minutes. This program will pursue innovative spacecraft and radar designs that minimize complexity and cost; e.g., by employing complex radar waveforms that address range ambiguities. Battlefield Visualization (BV) and geo-referenced Precision Guided Munitions (PGM) call for high-density, high-accuracy Digital Terrain Elevation Data (DTED). Affordable methods of obtaining this data from single and multiple satellites will also be explored.

(U) The Passive Radar Tag for Covert Communications will provide a covert capability to remotely extract data from unattended ground sensors and Special Operation Forces (SOF) in real-time by airborne sensors such as the Joint Surveillance Target Attack Radar (JSTARS) or Advanced Synthetic Aperture Radar System (ASARS) surveillance radar systems. Miniature prototypes have been developed for other radars such as the APS-137 and APS-145 used on the E-2C and P-3. The tags will use special wake-up circuitry, surface acoustic wave delay lines, and modulation techniques to detect, delay, and modify radar pulses from these radars such that the return pulse received by the radar will include unique identification numbers and data messages from the tag. Covertiness will be obtained by the choice of modulation and the amplitude of the returned signal. The interrogating radars will be modified to detect, identify, and display the tag message. Variants of the tag will be produced to be compatible with air delivered internetted

PE 0603226E, Project EE-27

ground sensors and with man portable tags used by SOf units. Low cost tags (<\$300) will be developed for cost effective and covert, friendly situational awareness. Other variants will be used to precisely register synthetic aperture radar imagery and to enhance communications of geolocation and other data between widely dispersed operating units.

(U) The Spectral Reconnaissance System will develop the next generation airborne reconnaissance system based on spectral imaging sensors. Such a system will enhance the ability to conduct wide area search for high value targets from both manned and unmanned airborne platforms. The program will develop a hyperspectral cueing and detection sensor and integrate this with a high image quality multispectral system. This system will be demonstrated on a Unmanned Air Vehicle (UAV) platform.

(U) In FY 1996, the Congress funded a Large Millimeter Wave Telescope as a potential joint United States/Mexico program to build and operate an adaptive, high precision, wide bandwidth, 50-meter aperture millimeter wave radio telescope. The sites being considered in Mexico offer low humidity and the ability to view both northern and southern skies. This telescope is being designed for a 5 microradian pointing accuracy, which, if achieved, would better the current state-of-the-art for radio telescopes.

(U) Program Accomplishments and Plans:

(U) FY 1996 Accomplishments:

- Developed baseline optical design for the Large Millimeter (MM) Wave Telescope Program. Completed preliminary design review for all antenna systems and radome for the Large MM Wave Telescope Program (\$3.0M)

(U) FY 1997 Program: N/A

(U) FY 1998 Program:

- Perform concept designs for the Tactical Radar Program. Develop and mature critical technology areas to include orbital configurations that when combined with innovative system concepts, can provide the required coverage frequency and ground resolution, complex radar waveforms that will address range ambiguities, and innovative system designs that minimize cost by reducing spacecraft complexity. (\$8.6M)
- The Passive Radio Frequency (RF) Tags for the Covert Communications program will perform concept analyses

for multiple concepts of operation to include remote communications of sensor data from unattended ground sensors, data communications from Special Operations Forces (SOF), geo-registration of Synthetic Aperture Radar (SAR)/Moving Target Indicator (MTI) imagery, and communications of geo-location and other data between dispersed operating units. System design for each operational concept will be conducted, and fabrication of brassboard RF tags, modifications to airborne SAR/MIT processors and ground stations will be completed. (\$9.3M)

- The Spectral Reconnaissance System will develop a Long Wavelength Infra-red (LWIR) hyperspectral cueing sensor for UAV application and a multispectral imaging sensor. These sensors will include both the hardware and software necessary for integration as an airborne wide area surveillance system. (\$7.0M)

(U) FY 1999 Program:

- Complete concept designs for the Tactical Radar program. Complete development and maturation of critical technology areas Initiate design and fabrication phase of program. Perform tests of new SAR waveforms and techniques using existing airborne SAR platform. (\$10.1M)
- The Passive Radio Frequency (RF) Tags for the Covert Communications program will test multiple brassboard RF tags and the modified airborne Synthetic Aperture Radar (SAR) and Moving Target Indicator (MTI) radar systems. Ground and flight tests with several airborne platforms will be performed to validate performance. Design and fabrication of miniaturized tags will be performed and a test and evaluation plan developed. (\$9.0M)
- The Spectral Reconnaissance System will test both the spectral cueing sensor and the high resolution multispectral imaging sensor. After performance verification, the two sensors will be integrated together as a wide area surveillance system. This system will be demonstrated on a manned platform and then integrated onto a Unmanned Air Vehicle (UAV) system. (\$7.7M).

COST (In Thousands)	FY 1996	FY 1997	FY 1998	FY 1999	FY 2000	FY 2001	FY 2002	FY 2003	Cost to Complete	Total Cost
Guidance Technology EE-34	11,876	11,499	27,661	29,600	29,212	28,000	34,200	52,000	Continuing	Continuing

(U) **Mission Description:** Fire-and-forget stand-off weapons need precise targeting information if critical fixed and mobile targets are to be eliminated effectively and with minimal collateral damage and minimum cost-per-kill. This requires that: (1) military surveillance and targeting systems geolocate targets accurately in the same coordinate system (i.e. WGS-84) in which the weapon system navigates; (2) the surveillance, targeting and weapon systems have precision navigation and guidance systems on-board; and (3) navigation and target location systems cooperate day/night and in adverse weather. In addition, future systems designed to accomplish precision strike missions must be significantly more affordable. The achievement of these characteristics in an integrated system is the goal of this program. The advanced navigation and guidance technologies being developed in support of this goal are called the Global Positioning System (GPS) Guidance Package (GGP). GGP technologies are applicable for both new or retrofit guidance/navigation packages to a variety of airborne platforms, ground vehicles, surface-to-surface standoff weapons and air-to-surface weapons. Additional thrusts are intended to increase the robustness of precision GPS navigation and to apply the technologies to the Advanced Tactical Targeting Technology Program.

(U) GGP tightly integrates a miniature GPS receiver and an all solid state, low cost, navigation-grade, interferometric fiber optic gyroscope (IFOG) based miniature inertial measurement unit (MIMU) with an advanced navigation computer into a low cost (\$15,000), precision navigation system. GGP Phase I addressed the technology issues involved in: (1) miniaturizing navigation grade inertial measurement units (IMUs) into a compact, manufacturable configuration; and (2) developing a multi-channel-on-chip, high dynamics GPS receiver. A Memorandum of Agreement (MOA) has been signed and implemented to demonstrate a Phase I unit on an Army Fire Support Team Vehicle (FIST-V). Successful demonstrations were conducted at Redstone Arsenal in June 1995 using a M981 FIST-V. GGP Phase 2 requirements place more stressing demands on performance of MIMU components and call for further reductions in size, power and weight. An MOA has been signed with the Navy designating GGP Phase 2 as the Navy's Advanced Integrated Navigation and Control Package. Another MOA was signed with the Program Executive Officer, Tactical Missiles, Army Missile Command. Potential applications include the Multiple Launch Rocket System. A third MOA is in coordination with the Project Manager, Bradley Fighting Vehicle Systems, Army Tank and Automotive Command. Potential application is the Bradley Fire Support Team Vehicle.

(U) The thrusts within the GPS Guidance Package (GGP) Program will also increase the robustness of GPS receivers by increasing their ability to operate effectively in presence of enemy jamming or countermeasures. The all-in-view Miniature GPS Receiver (MGR) chipset will be upgraded to demonstrate direct precision GPS code acquisition by employing a fast acquisition correlator engine and high performance clock. Operation with precision GPS code signals increases the MGRs robustness to jamming. The program will provide for the design, development, implementation and demonstration of a low cost, all digitally controlled GPS adaptive phased array receiver antenna; coherent precision matched analog antenna components; and antenna recalibration for stressing military environments. These technologies also increase MGR robustness to jamming. Finally, the GGP Program will develop and demonstrate a low power, long endurance MGR. This will increase MGR battery endurance, and thus availability of accurate navigation, from hours to days for dismounted troops.

(U) The Advanced Tactical Targeting Technology (AT3) will demonstrate a passive tactical targeting system for the lethal suppression of enemy air defenses (SEAD). AT3's objectives are to develop passive targeting technologies with precision time standards, wideband low cost multichip module based radio frequency (RF) receivers and threat association algorithms and to demonstrate an affordable tactical targeting system solution. Two airborne architectures will be considered. One will employ AT3 systems on an opportunistically diverse mix of platforms netted together by communications links. The other will employ a single strike aircraft with two or more dedicated miniature air-launched radar decoys, each carrying an AT3 and communication system. The SEAD mission must now be accomplished in the face of new electronic order of battle (EOCB) and new engagement tactics by enemy air defenders such as frequent threat emitter shutdowns. Today's targeting systems fail to provide timely information to target the growing mobile threat. Far more comprehensive, near real time, cockpit battlefield awareness must be provided. This includes synchronization of multi-platform information, long range emitter identification and target geolocation within seconds. An order of magnitude improvement in rapid target geolocation accuracy is needed against mobile surface to air missiles. Emerging DARPA technologies can combine to provide an affordable lethal SEAD tactical targeting capability. These include leveraging the GPS Guidance Package and cesium clock technologies for precision time and location. Low cost, light weight RF wideband digital receiver, processor and adaptive antenna functions can be implemented in advanced technology multichip modules.

(U) Program Accomplishments and Plans:

(U) FY 1996 Accomplishments:

- Continued Global Positioning System (GPS) Guidance Package (GGP) Phase 2 designs. (\$10.6M)

R-1 ITEM DESCRIPTION

Experimental Evaluation of Major
Innovative Technologies,
PE 0603226E, Project EE-34

- Conducted integration of Phase 1 GGP units on a Navy testbed (F/A-18) aircraft. (\$1.3M)

(U) FY 1997 Program:

- Complete GGP Phase 2 designs and begin fabrication of two competitive GGP units. (\$10.4M)
- Complete evaluation of Phase 1 units on the Navy testbed aircraft. (\$.1M)
- Investigate and evaluate applications of the Miniature GPS Receiver (MGR) and other relevant technologies for concepts to suppress enemy air defenses. (\$1.0M)

(U) FY 1998 Program:

- Continue fabrication and begin integration of GGP hardware and software. (\$10.0M)
- Design circuits and power management techniques for the direct precision GPS code, low power, robust MGR. (\$5.1M)
- Design the GPS adaptive antenna array, signal processing and control functions for the MGR. (\$4.1M)
- Initiate Advanced Tactical Targeting Technology (AT3) design and development. (\$8.5M)

(U) FY 1999 Program:

- Perform final integration and testing of GGP units; deliver eight units. (\$4.6M)
- Complete design and begin fabrication of the robust MGR. (\$5.0M)
- Conduct final design reviews for adaptive GPS receiver antenna and signal processing. (\$2.9M)
- Conduct final design reviews for robust GPS receiver antenna and signal processing. (\$.8M)
- Fabricate robust GPS receiver antenna. (\$4.3M)
- Complete AT3 design and conduct breadboard component demonstrations. (\$12.0M)

<p>*In FY 1997, this project consolidates programs under PE 0603226E, Project EE-39 and PE 0603569E, Project AS-01.</p> <p>Project EE-39 (33,901) (8,897)</p> <p>Project AS-01 (31,400) (31,910)</p>											
<p>(U) Mission Description: The objectives of this project are to develop and demonstrate advanced systems concepts and to pursue critical enabling technologies for maritime systems that will counter the threat created by the world-wide spread of increasingly sophisticated military technology. The evolving threat of quiet diesel submarines, the proliferation of sophisticated submarine and weapons capabilities, and the growing stockpile of underwater mines available to third world countries necessitates the development of far-term solutions for increasing ship affordability and enhancing our operating capabilities in the littoral. This project will provide advanced technologies to enhance the capabilities of naval forces to more effectively operate "...forward from the sea" in a broader range of tactical environments.</p> <p>(U) The Advanced Ship-Sensor Systems Program includes Sensor and Sonar Technology, Advanced Ship Mechanical Systems, and Advanced Maritime Platforms. In the Sonar Technology area, applications of advanced object detection, classification, and localization technologies using High Performance Computing (HPC) are demonstrated. Active and passive sonar techniques are applied, using advanced sources and sonar systems built from distributed elements or concentrated arrays. Advanced signal processing techniques to integrate real-time information and background intelligence into the operational situation are included. These applications will result in enhanced Anti-Submarine Warfare (ASW) capability against diesel-electric submarines operating in shallow water. In the Advanced Ship Mechanical Systems area, technologies such as precision active structural controls, actuator and sensor systems and high speed digital signal processing are being developed. These technologies will result in reduced ship acoustic signatures, high performance/high reliability propulsion systems, a safer/more survivable ship, and increased ship system affordability. Advanced Maritime Platforms efforts focus on the technologies for innovative ships and ship systems to provide the multi-mission, sustained presence capability required for joint operations associated with future regional conflicts. The advanced ASW program addresses coordinated source and receiver concepts to substantially increase the range for reliable detection and classification of quiet submarines. A particular focus is waveform design for optimal noise rejection and enhancement of target echoes.</p>

APPROPRIATION/BUDGET ACTIVITY RDT&E, Defensewide BA 3 Advanced Technology Development	R-1 ITEM NOMENCLATURE Experimental Evaluation of Major Innovative Technologies, PE 0603226E, Project EE-36	
<p>(U) In FY 1997, this project incorporates the following programs formerly budgeted under the Advanced Submarine Technology Project (AS-01) and the Unmanned Undersea Vehicle (UUV) Project (EE-39). Innovative technologies to significantly enhance submarine stealth and survivability including hydrodynamic control, advanced materials/structures, and structural acoustics efforts to reduce ship observables will continue to be developed and demonstrated. They form the basis for efforts addressing affordability through improvements in structural acoustic design capabilities, innovative machinery mounting systems and high reliability propulsion systems. The Supercavitation Technology Program will continue to address the physics of launching and propelling underwater bodies at velocities approaching the speed of sound in water. UUV technologies brought forward involve development of a Synthetic Aperture Sonar (SAS) system to increase underwater search rates for mine detection and classification.</p> <p>(U) <u>Program Accomplishments and Plans:</u></p> <p>(U) <u>FY 1996 Accomplishments:</u></p> <ul style="list-style-type: none"> • Completed development of multistatic active processing and impulsive sources for shallow water tactical sonars. Completed assessment of potential of multistatic active adaptive technology. Completed system integration and end-to-end testing for fleet Anti-Submarine Warfare (ASW) demonstration of multistatic active tactical processor and other components. (\$9.0M) • Accelerated autonomous ASW detection effort and extend to multi-targets and broader application to fleet systems. Deployed and evaluated initial (one class) autonomous submarine detection and classification package. (\$3.5M) • Exploited available wide-swath, mine SAS sea test data, investigated potential improvements which can be realized by incorporating state-of-the-art motion compensation. (\$.5M) • Explored stand-alone, low-frequency, acoustic source options for insensitization of high interest, littoral waters to support high probability ASW search of these areas. (\$.5M) • Evaluated enhanced torpedo attack phase performance to be realized from fiber optic weapon link to launch platform and initiate planning for feasibility demonstration. (\$.4M) • Performed studies to develop technology options for future surface ships including the initial support activities related to a joint Navy/DARPA program for arsenal ship development. This work led to activities performed under Project EE-47 starting in FY 1997. (\$1.0M)

<p>• The following activities were funded by Congressional additions to the FY 1996 President's Budget:</p> <ul style="list-style-type: none"> - Completed design and assemble off-board autonomous detection and classification package in preparation for demonstration in sea test. (\$2.9M) - Conducted simulation and modeling of information exchange and potential improvements among fleet platforms, ASW sensors and other sources to establish a basis for pursuing performance technical enhancement opportunities. (\$2.0M) - Developed a design and system architecture for an autonomous deployable sensor package suitable for long term monitoring of disposal sites for the Deep Ocean Relocation Program. (\$2.5M) - Developed design concepts for improved survivability of naval combatants-damage control without direct crew participation. Developed and demonstrated proof-of-concept sensors/sensor network to remotely monitor, assess, and control casualty conditions throughout the ship. (\$1.9M) <p>(U) FY 1997 Program:</p> <ul style="list-style-type: none"> • Complete final at-sea ASW demonstration of environmentally adaptive shallow water active sonar technology in conjunction with single/few platform scene generation capability. (\$1.2M) • Conduct tests to determine the effectiveness of supercavitating high speed bodies against fixed targets. (\$.8M) • Complete development of autonomous ASW multi-target detection technology. (\$.8M) • Fabricate and integrate a prototype active transmission vibration isolation mount. (\$3.1M) • Initiate development of a large scale Electromagnetic Turbulence Control application for at-sea demonstration of drag reduction, maneuvering control, and signature control. (\$2.0M) • Initiate development of the Netted Acquisition and Targeting (NAT) for littoral surveillance to include an acoustic source, as well as signal processing for enhanced detection and attack performance. (\$4.5M) • Design and initiate the fabrication of a prototype acoustic mine detection and classification system for a large (10 sqm/hr) area coverage rate. (\$1.0M) • Develop space-time adaptive processing techniques and perform ocean tests to enhance long range active coherence and towed array detection performance. (\$2.5M)

FY 1996 Reflects Bosnia reprogramming (\$-.8 million), transfer of sensor systems to the Small Unit Operations, Project EE-51, (\$-.8 million), and Arsenal Ship studies (\$+1.0 million) and minor repricing (\$-.5 million).

FY 1997 Reflects repricing of the acoustic mine detection system and the vibration isolation mount effort.

FY 1998 Minor program repricing.

FY 1999 Reduction reflects transfer of funds to Project EE-47 for support of the Arsenal Ship Program and restructuring of the following: fabrication and test of a supercavitating gun and high speed torpedo demonstrator, multiple target autonomous detection technology, and synthetic aperture sonar technology enhancement effort.

(U) Other Program Funding Summary Cost: N/A

(U) Schedule Profile:

Plan Milestones

4QFY96 Conduct an at-sea demonstration of multistatic active adaptive processing for shallow water tactical sonars.

4QFY96 Conduct proof of concept test for acoustic mine detection and classification system.

4QFY96 Complete Large-Scale Demonstration of advanced Aeroderivative Engine active control technology.

4QFY96 Conduct at-sea demonstration of an autonomous submarine detection and classification system.

4QFY96 Complete preliminary design for a Mobile Offshore Base (MOB) concept.

4QFY96 Demonstrate simulation and visualization techniques of dredged material isolation process.

(U) **Mission Description:** The strategic environment in which the United States operates will require Joint Forces to operate across the full spectrum of conflict. At the same time, resources will continue to shrink, requiring the Department to search for the most cost effective means to perform the full spectrum of defense functions. To support the National Military Strategy, the Advanced Distributed Simulation (ADS) program is developing advanced simulation technologies to construct a seamless synthetic battlespace that will permit high fidelity simulation across the full spectrum of conflict and will enable fundamental changes in how defense functions are accomplished. The ultimate goal is to create simulation technologies capable of representing Joint Forces from the level of operations other than war up to an MRC level of combat, and supporting the following functions: Joint/Service readiness training and mission rehearsal; Joint/Service doctrine development and refinement; requirements analysis; design and prototyping; and operational/tactical planning. Specific technology efforts being undertaken as part of this project include large scale simulation system design interfaces to real world C4I systems advanced distributed networking and after action review technologies. As technologies mature, they are integrated, tested and demonstrated in exercises of varying size, complexity and utility. These technologies will transition to service and joint simulation developers, e.g. JSIMS, WARSIM, NASM, JSIMS Maritime component, as well as to STOW's international partner, the United Kingdom, etc.

(U) The Synthetic Environment component concentrates on the creation of large scale synthetic environments including representation of dynamic terrain and targets, weather and environmental phenomena, as well as seasonal and diurnal variations. The Synthetic Forces component creates a scalable, computer-generated joint military force that is representative and behaviorally credible. This simulation includes models of command nodes, various intelligence sensors and their related platforms. The high fidelity of the computer generated forces provides the capability to resolve battle outcomes at the weapon system level of detail. The system design and integration component develops the overall DoD High Level Architecture (HLA) occupant system architecture, interfaces to C4I systems, communication networking, distributed exercise management, data collection and, after action reviewed technologies. This architecture supports the capability to initialize, manage, and analyze large scale distributed joint as well as combined exercises. The Networking and Information Transfer Technology Development Program investigates and develops the technologies necessary to take full advantage of capabilities offered by the next generation communication networks. These technologies facilitate efficient and cost effective utilization of evolving network infrastructure

while supporting the requirement to represent 100,000 entities interoperating over the network, in either perceptible real time or faster than real time.

(U) The Synthetic Theater of War (STOW) program has been designated an Advanced Concept Technology Demonstration (ACTD) with USACOM as the user. STOW is developing a HLA compliant prototype simulation system which enables creation of a seamless synthetic battlespace to support joint and combined training as mission rehearsal activities. The STOW prototype will play in USACOM's JTF level exercise Unified Endeavor in Nov 1997 and in subsequent USACOM exercises during FY 1998 and FY 1999. STOW technologies and user experience with these technologies will transition to JSIMS, WARSIM and other service simulation systems.

(U) The Operational Simulation Technology Program has been divided into two programs. The Advanced Simulation Technology Thrust (ASTT) develops simulation technology supporting the next generation of DoD simulation systems. Detailed coordination has been established with JSIMS, WARSIM and other service simulation developments. This program will extend core simulation technology research into areas not currently under develop by the Synthetic Theater of War Program such as advanced synthetic environments modeling, multi-resolution modeling, and scaling. The ASTT program will act as a bridge to future DoD simulation developments such as the Joint Simulation System (JSIMS). The other facet of the Operational Simulation Program will integrate Advanced Distributed Simulation and ASTT developed technologies into an operational planning systems to provide course of action analysis. This is a cooperative program with the Command and Control Division, Information System Office.

(U) Program Accomplishments and Plans:

(U) FY 1996 Accomplishments:

- Developed and demonstrated improved network technologies supporting interaction of 10,000 entities within the HLA compliant simulation operating system. Tested and integrated NSA developed, ATM based, network security devices. (\$3.4M)
- Improved and demonstrated the technology necessary to create a synthetic battlespace to include increased fidelity of terrain and environmental effects (e.g. fog, smoke, haze); continued development of terrain and environmental data bases to support STOW 1997. Initiated efforts to transition to a HLA compliant system. (\$6.1M)
- Developed synthetic, artificially intelligent, command entities; expanded development of synthetic forces to include representations of additional battlespace entities for all services. Improved functionality and

<p>Interoperability of existing synthetic forces. Developed and tested a set of standard interface specifications capable of accommodating a variety of technical architectures which represent service unique command and control features. Initiated efforts to transition to a HLA compliant subsystem architecture. (\$23.2M)</p> <ul style="list-style-type: none"> Developed a STOW simulation operating system, tested and integrated technologies, and continued development of the STOW Advanced Concept Technical Demonstration (ACTD) prototype simulation for the STOW-97 ACTD. (\$19.9M) Continued development of advanced simulation technologies to include initial use of automatic code generation to create synthetic forces from high level specifications; and initiated development of semi-automated scenario setup. Faster than real time simulation, and improved efficiencies for generating simulations Program focus directed towards JSIMS, WARSIM and other service simulations. (\$4.3M) Demonstrated the capability to utilize concurrent engineering tools for land vehicle design, link to synthetic battlefield environments, and the requirements to design through virtual prototypes. (\$4.2M) <p>(U) FY 1997 Program:</p> <ul style="list-style-type: none"> Continue to develop and transition HLA compliant synthetic environment technology. Continue development of environmental technologies capable of supporting an environmentally robust battlespace to include interactive terrain, battlefield obscuration, diurnal effects. Develop technology for simulating the full range of dynamic terrain effects, e.g. cratering, building positions, fighting. (\$6.1M) Continue to develop and transition a broad range of synthetic forces representing combat elements; integrate with the DoD HLA a distributed command and control structure portraying in simulation the influence of one command level on the actions of the subordinate synthetic formations. Continue to develop and demonstrate increasingly more sophisticated behaviors representing an extended set of battlespace reactions such as situational awareness, reaction to the environment and tactical planning. Continue to re-architect synthetic forces to a HLA compliant design. (\$15.2M) Demonstrate a prototype Joint Synthetic Theater of War simulation system supporting a seamless land/sea/air warfighting synthetic environment capable of representing up to 50,000 entities with a high degree of realism, supporting Service and Joint operational training while retaining the arbitration of battle outcomes at the entity level of detail. Integrate and test expanded HLA compliant network and information transfer various technologies and network security devices. Transition technologies and simulation components to JSIMS, WARSIM and other service simulations. (\$12.9M)

Current Budget	61.1	47.3	33.5	21.7

(U) Change Summary Explanation:

FY 1996 Reflects inflation savings (\$-6 million), reductions to the core simulation technologies development program (\$-3.5 million), and transfer of SBIR set aside to PE 0605502E (\$-.9 million).
FY 1997-99 Reflects repricing of current technology initiatives and reductions in keeping with JCS direction to reduce simulation activities.

(U) Other Program Funding Summary: Cost: N/A(U) Schedule Profile:

Plan Milestones

Sep 96 Demonstrate and assess the capability of concurrent-engineering tools for land vehicles design using engineering work stations, the driving simulator, and the synthetic battlefield.

Sep 96 Demonstrate advanced network technologies to include dynamic multi-casting.

Jan 97 Conduct technical Engineering Demonstration #2 of integrated STOW Technologies.

Oct 97 IAW CMC USACOM, demonstrate the STOW 97 prototypes ability to support the joint and combined rehearsal of tactically significant military operations.

Nov 97 Demonstrate 10-20,000 objections operating in a distributed simulation exercise with Battalion and Navy CFOR entities and rapid behavior modification capability.

Nov 98 Demonstrate initial coarse of action capability based on simulation interconnection.

COST (In Millions)	FY 1996	FY 1997	FY 1998	FY 1999	FY 2000	FY 2001	FY 2002	FY 2003	Cost to Complete	Total Cost	
Air Defense Initiative EE-41	24,881	21,377	0	0	0	0	0	0	0	N/A	
<p>(U) <u>Mission Description:</u> Air Defense Initiative (ADI) programs form a critical part of the Defense Advanced Research Project Agency's (DARPA) program to ensure defense against cruise missiles and manned aircraft. The programs also complement systems being pursued by other program offices to counter theater ballistic missile threats. The rapid evolution and spread of cruise missile systems and technologies require new approaches and technologies to ensure effective and efficient countering of future airbreathing threats to assets in regional theaters.</p> <p>(U) The DARPA Mountain Top Program provided a cost effective ground-based radar system for the advancement and evaluation of concepts and technologies required for future airborne surveillance radars. In FY 1996, the Mountain Top Project was divided into the Radar Surveillance Technology Experimental Radar (RSTER) hardware program segment and the signal processing and analysis effort. The RSTER system continues to serve as the focal point for the Mountain Top Program and program activities continue to concentrate on joint testing and integration to effect a successful RSTER system transition to the Services, specifically, the Navy E-2 Program Office, PMA-231, by FY 1998.</p> <p>(U) Advanced Signal Processing Program includes the Common Research Environment for Space Time Adaptive Processing (STAP) Technology (CREST), Algorithm Development Tool (ADT) set designs, signal processing and analysis, and algorithm development and evaluation. Specific efforts are focused on the Navy E-2C Hawkeye and the Air Force E-3 Airborne Warning and Control System (AWACS).</p> <p>(U) The DARPA Simulation (Transition Support) Program conducts integrated analysis, modeling, simulated exercise, and demonstration efforts to develop Advanced Air Combat Concepts (A2C2) using DARPA technologies and to facilitate technology transition to the Services. Examples of these concepts include advanced fire control support for the Air Force and Navy fighters as well as air directed surface-to-air missile (ADSAM) operations of Army and Navy systems. Analysis and modeling efforts will be performed to develop and refine employment architectures and concepts of operations (CONOPS) utilizing DARPA technologies. Primary vehicles for these efforts will be in-house analyses, contracted studies, support for the Joint Staff (J-8) led Joint Cruise Missile Defense (JCMD) Study, and seminar wargames used to create and assess robust warfighting concepts supported by DARPA technologies. Field demonstration scenarios will be derived from the analysis and modeling effort, combined with simulated exercises to facilitate operator involvement early in the process.</p>

(U) Mission Description: This program develops and demonstrates advanced communications technologies needed for defense and intelligence operations for the 21st century. The program will develop advanced information processing concepts to support a geographically dispersed staff for crisis management. Services for an enhanced information infrastructure to support command and control will be developed and demonstrated to be applicable to advanced, high performance networks. This program will demonstrate that commercial communications resources and technologies can be integrated with advanced optical components developed in this program as well as DoD tactical and satellite technologies developed elsewhere.

(U) The key elements are: 1) Applications such as intelligent decision aids, that enable a geographically distributed planning staff to develop and analyze a course of action; 2) Advanced services such as scalable file systems, databases, and distributed computing support that are integrated with high performance computing, and free applications from the necessity to work down to the raw data transport level; 3) Demonstration networks that validate the research and development and enable early application development and technology transition into DoD efforts such as Defense Information System Networks; 4) Develop network controls pertaining to management, and security software technologies to enable sensor-to-shooter applications combining all network media; and 5) Develop advanced optoelectronic network component technology and network architecture for scalable and modular networks. The aggregate network bandwidth will be in the range of terabits per second and the network will handle multi-media service for both digital and analog signals.

(U) Program Accomplishments and Plans:

(U) FY 1996 Accomplishments:

- Demonstrated evolving software development practices and the migration of software applications and information services to higher bandwidth networks in an operational exercise involving multiple JTFS. (\$17.0M)
- Demonstrated integration on a CONUS/International scale of all networks and demonstrate end-to-end secure transmission and signaling at gigabit rates. (\$4.9M)
- Demonstrated high bandwidth operation of critical multi-wavelength components. (\$7.3M)

FY 1996 Decrease reflects Bosnia reprogramming action (\$-.6 million).

FY 1997-99 Changes reflect repricing of JTF program.

(U) Other Program Funding Summary Cost: N/A

(U) Schedule Profile:

Planned Milestones

May 96 Demonstrate network combining crypt, commercial communications, and defense secure wireless, satellite.

May 97 Demonstrate integration with advanced optical testbeds. Conduct large scale planning demonstrations.
Jul 97 Complete first phase of deployable JTF C3 development (mobile C3, plan rehearsal and refinement during deployment, intelligent interfaces).

May 98 Complete large-area demonstration of optical network and advanced network management.

Sep 98 Demonstrate initial execution and dynamic replanning functionality.

Jun 99 Demonstrate 20 gigabit per second, multi-channel, multi-media, large-area network.

Jul 99 Demonstrate advanced execution and dynamic replanning functionality.

COST (In Thousands)	FY 1996	FY 1997	FY 1998	FY 1999	FY 2000	FY 2001	FY 2002	FY 2003	Cost to Complete	Total Cost
Defense Simulation Internet (DSI) EE-46	25,612	37,119	2,880	1,500	1,500	1,500	0	0	0	N/A

(U) Mission Description: The goal of the Defense Simulation Internet (DSI) program is to research, develop and test at scale (worldwide), a network infrastructure capable of enabling distributed, real-time, multi-media (video, voice, shared data and work spaces) simulation that will seamlessly integrate all simulation, modeling, command and control functions from early design to battle rehearsal enroute to the conflict. The DSI meets DoD security requirements by using a commercial-off-the-shelf (COTS) encryption device (INES). The communications needs of the distributed, real-time, multi-media modeling and simulation community cannot be met with any other available technology. Commercial vendors are pursuing some of the required technologies, but development is too slow and unfocused to accommodate the immediacy of the Department of Defense's simulation requirements. The DSI program provides focus for the commercial development of the technologies needed by the simulation community for distributed work environments worldwide. Over 100 nodes currently extend the DSI to each of the Services, most of the Commanders-in-Chief (CINCs), some of our allies and other Government affiliated sites. These locations constitute the network's user sites; they provide valuable feedback on the technologies and methodologies being pursued and critical capability for both ongoing and major modeling and simulation events. A key mission of the DSI is to provide real time infrastructure for the Synthetic Theater of War (STOW) 97.

(U) The DSI will transition to the Defense Information Systems Agency (DISA) Defense Information Systems Network (DISN) by the end of FY 1997 and be operated on a reimbursable basis. It will be jointly managed by DISA and DARPA through the Advanced Information Technology Systems Joint Program Office. The transition of the DSI into the DISN provides affordability through consolidation of the costs required to operate multiple networks while continuing to support modeling and simulation requirements.

(U) Program Accomplishments and Plans:(U) FY 1996 Accomplishments:

- Provided network operations and user services. The DSI became a virtual network of DISN during the 3Q FY 1996, containing an estimated 30% more user sites. Operations included the 24 hours per day/7 days per week

cost (In Thousands)		FY 1996	FY 1997	FY 1998	FY 1999	FY 2000	FY 2001	FY 2002	FY 2003	Cost to Complete	Total Cost
Arsenal Ship/Fast Ship EE-47		0	16,000	48,000	50,000	36,000	22,000	0	0	0	N/A
<p>(U) Mission Description: In the Arsenal Ship/Fast Ship Project, DARPA will identify and develop high leverage technologies and acquisition improvements to support future surface ships with an emphasis on littoral missions. The objectives of this new project have far-reaching implications for the future of surface ships for the US Navy. The project is currently structured in two parts:</p> <p>(U) Arsenal Ship is a high priority joint Navy/DARPA program to acquire a new capability for delivery of large quantities of ordnance (approximately 500 Vertical Launch System (VLS) cells) in support of land and littoral engagements. Key to both arsenal ship's affordability and operational flexibility is off-board integration of all but the most rudimentary C4I. The ships are to be theater assets that will operate under the authority of the joint Commanders-In-Chief (CINC's) and will receive their targeting along with command and decision information from other assets. Early in arsenal ship's life this control will be exercised through an Aegis platform, though as other assets mature, control will transition to aircraft such as AWACS or an E-2 with Cooperative Engagement Capability (CEC) and eventually to the Marine or Army shooter on the ground. Thus, the Arsenal Ship will not be fitted with long range surveillance or fire control sensors, but will be remotely controlled via robust data links. The data links will be secure, redundant and anti-jam in order to provide high reliability in the connectivity of the Arsenal Ships in high jamming operational scenarios. The overall program is an attempt to leverage the significant joint investment in Link 16 and CEC. The Arsenal Ship's survivability will be primarily achieved through passive design techniques. While active systems are not ruled out, they must be consistent with overall cost and manning goals. These design goals will allow the Arsenal Ship to have a very small crew (potentially, none at all) which will be a key ingredient in minimizing its life cycle costs.</p> <p>(U) This demonstration program is a non-ACAT (Acquisition Category) program to design the arsenal ships and to construct and test an arsenal ship demonstrator (ASD) to evaluate this new capability while minimizing the risks in acquisition of approximately six ships (to include conversion of the arsenal ship demonstrator to a fleet operational unit).</p>

<p>(U) As a result of studies that DARPA has performed, it is very clear that we should expect significant re-trenching from overseas deployments by US forces. This, coupled with the growing unaffordability of maritime pre-positioned logistics, will require that future forces be deployable from CONUS. The large travel distances suggest major payoffs for achieving speeds in excess of 50 or 60 knots and, in fact speeds of 75 knots or greater show major payoffs. We will explore the potential for sealift deliveries at speeds up to 100 knots to determine the breakpoints for cost and feasibility.</p>

Combat Hybrid Power System EE-48	0*	15,400	25,000	28,500	18,000	17,000	4,000	0	0	N/A

*The Integrated Product and Process Development Program (EE-37) is developing concurrent engineering/virtual prototyping technology that will be used in the conceptual design and analysis of the Combat Hybrid Power System.

(U) **Mission Description:** The Combat Hybrid Power System project is developing key power management technologies to enable Cavalry/Scout and combat vehicles to fully satisfy mission requirements. Essential requirements for U.S. Cavalry/Scout Ground Unit Operations and Small Unit Operations are to acquire threat information, locate targets, communicate, reduce signatures, and be more mobile and survivable. Essential requirements for close combat units are simultaneous, sustained offensive mobility, overmatching lethality and survivability against heavy threat firepower. The platforms must be air deployable which dictates weight and volume constraints. The military is developing an array of subsystems to support these missions that include: advanced sensor suites and communication equipment, active suspension and electric propulsion systems, signature management suites, countermeasures, active defense, and electric weapons. These subsystems require either continuous or pulsed electric power and in each case a dedicated electrical power supply has been developed for each subsystem. Integration of multiple power supplies into a vehicle is not feasible due to space constraints, cost, and efficiency.

(U) The objective of the Combat Hybrid Power System program is to develop enabling technologies and conduct demonstrations of an integrated hybrid electric power system which provides power and energy management for all of the subsystems throughout the cavalry/scout vehicle and is scaleable to combat systems. The hybrid electric power system will consist of an engine/alternator, sized for average power demand, energy storage and power averaging components which provide both continuous and pulsed power, distribution network, subsystem control and power conditioning devices. Vehicles will be simulated to evaluate subsystem requirements, topologies, and military utility.

(U) The Reconnaissance, Surveillance, and Targeting (RST) Vehicle Technology program will design, develop, test, and transition to the services critical components and technology for a lightweight, highly maneuverable vehicle. The vehicle will host integrated precision geolocation, communication and RST sensor subsystems provided by DARPA's Small Unit Operations Program. The RST vehicle is the essential mobility aspect of the DARPA, U.S. Army, and Marine Corps futuristic concepts of the use of small unit operations.

APPROPRIATION/BUDGET ACTIVITY RDT&E, Defensewide BA 3 Advanced Technology Development		R-1 ITEM NOMENCLATURE Experimental Evaluation of Major Innovative Technologies, PE 0603226E, Project EE-48	
<p>Critical components and technologies include a high efficiency, reduced signature hybrid electric power system; an electric propulsion system; a semi-active electromechanical suspension to double cross country speed and provide platform stabilization; an advanced survivability suite; and the capability to operate as either a manned or unmanned platform. The Marine Corps will develop vehicle concepts and chassis, integrate the DARPA developed components, and conduct vehicle performance tests (PE 0603640M). Additional co-funding for semi-autonomous capability will be provided by the Office of Secretary of Defense Joint Robotics Program (PE 0603709D).</p> <p>(U) Hybrid electric power is an enabling technology for future combat vehicles if electrically powered subsystems are to be implemented. The vehicles will have greatly reduced noise and thermal signatures; and improved mobility, survivability, lethality, and fuel economy. By eliminating rigid connections between components, interior layout can be optimized, significantly reducing volumetric constraints. These advantages will result in deployable, affordable combat vehicles that meet mission requirements. The programs are closely coordinated with the U.S. Army, Navy, Marine Corps, the DARPA Electric Vehicle Program (EV-01), and the DARPA Small Unit Operations Program (EE-51).</p> <p>(U) <u>Program Accomplishments and Plans:</u></p> <p>(U) <u>FY 1996 Accomplishments:</u></p> <ul style="list-style-type: none"> The Integrated Product and Process Development Program (EE-37) developed concurrent engineering/virtual prototyping technology that will be used in the conceptual design and analysis of the Combat Hybrid Power System. (U) **Mission Description:** The objective of this program is to develop and demonstrate a Low Observable High Altitude Endurance Unmanned Air Vehicle (LO HAE UAV) system, including a ground segment, capable of providing the war fighter with the near real time ability to assess battlefield situations. This system will provide continuous, all weather, day/night, wide area reconnaissance and surveillance in direct support of the Joint Forces Commander. It will consist of aircraft, sensors, communications and interfaces to theater systems in support of tactical warfighters at various levels of command. The LO HAE UAV will provide wide area search (over 15,000 sq nm per mission) with either an Electro-Optical (EO) or Synthetic Aperture Radar (SAR) system at 1m resolution. In addition, it will provide 600 spot images per mission with either sensor at 0.3m resolution. The search and spot modes can be interleaved with attendant reductions in the overall coverage. The system will support a targeting accuracy of at least 20m circular error probability (CEP).

(U) The low observables capabilities of the system will allow it to operate in high threat environments where manned reconnaissance or other operational assets are not viable options.

(U) Program Accomplishments and Plans:(U) FY 1996 Accomplishments:

- Complete system integration and initiate Phase II flight test. (\$11.2M)
- Prepare Air Vehicle #2 for Flight Test. (\$12.0M)

(U) FY 1997 Program:

- Complete System Integration and Flight Test of Air Vehicle #2. (\$14.7M)

(U) FY 1998 Program:

- Prepare and Flight Test Air Vehicle #3. (\$5.0M)

(U) FY 1999 Program: N/A

* Programs included in this project were previously funded under Project EE-40.

(U) **Mission Description:** This project represents a refocusing and transition of pertinent elements of the Critical Mobile Targets (WAR BREAKER) project (EE-40) into a concentrated effort to empower the battle commander with comprehensive battlespace awareness. The development efforts described herein embody key sensor demonstrations and the exploitation of sensor products. These efforts, in conjunction with those described in Project EE-53 (Information Integration Systems), seek to develop the systems needed to provide the warrior with situational awareness and battlefield dominance. The strategic goal of this project is to utilize diverse, complete, sensing of the battlefield environment, including sensors which can counter Camouflage, Concealment and Deception (CC&D), and provide near-real-time, semi-automatic, exploitation of wide-area moderate (and high) resolution imagery and provide semi-automated recognition and birth-to-death tracking of high value units and critical moving targets. These goals are being addressed by the Counter CC&D Program, the Semi-Automated Imagery Intelligence (IMINT) Processing (SAIP), Advanced Concept Technology Demonstration (ACTD), Moving and Stationary Target Acquisition and Recognition (MSTAR), Moving Target Exploitation (MTE), and Automatic Target Recognition (ATR) applications programs.

(U) The goal of the Counter CC&D Program is to provide significant enhancement of the military's capability to detect obscured targets hidden under natural and artificial camouflage. Specific goals include validation of Foliage Penetration (FOPEN) target detection capability (0.1 FA/sq.km max) with data from the P-3 Ultra-Wideband UHF Synthetic Aperture Radar (SAR) testbed and the DARPA-sponsored Swedish Carabas I Very High Frequency (VHF) SAR tests; and demonstrations of real-time processing of FOPEN high resolution SAR image formation, Radio-Frequency interference (RFI) suppression and Automatic Target Detection/Classification (ATD/C) algorithms. A FOPEN Airborne Demonstration Radar will be developed for demonstration on a manned platform providing inputs via narrowband tactical data links for ground image exploitation. The image exploitation processing of SAIP will be extended for FOPEN as well as Multi/Hyper Spectral Image (M/HSI) sensor input, geolocation and sensor fusion processing of images, and detection of time critical targets. The program will ultimately combine FOPEN Radar on an Endurance Unmanned Aerial Vehicle (UAV); with other airborne sensors (e.g., the Senior Year Electro-optical Reconnaissance System on the U-2, a HSI sensor on the Predator Medium Altitude Endurance UAV), and develop combined exploitation technologies for insertion into the DARO Common Imagery Ground/Surface System (CIGSS).

<p>(U) The Semi-Automated IMINT Processing (SAIP) ACTD will develop, test and transition to the operational user, automated algorithms and semi-automated tools that enhance the warfighter's capability to: Process SAR, then EO/IR, and eventually multispectral imagery; conduct wide-area search for Ground Order of Battle and Missile Order of Battle targets; perform rapid site-monitoring and site modeling; and produce target reports in near real-time (< five minutes). SAIP will consist of baseline, enhanced, and transition systems. Goals for the baseline system are: automatic target cueing and classification for a limited set of vehicles (10 targets); object level change detection; force recognition to the company level; and interactive target recognition and terrain delimitation. Goals for the enhanced system are: Increasing the automatic target cueing and classification to 20 targets; site modeling and monitoring with EO; addition of SIGINT cueing; and rapid target insertion. Goals for the transition system are to add enhanced automatic target recognition (30 targets); flexible force recognition to the regiment level; site modeling and monitoring with SAR data; rapid target insertion and; on-the-fly training. SAIP will integrate program products that are being refocused and transitioned from the WAR BREAKER program.</p> <p>(U) The goal of the Moving and Stationary Target Acquisition and Recognition (MSTAR) program is to achieve a major advance in SAR Automatic Target Recognition (ATR) performance through fundamental and innovative technology developments and to transition this technology to fielded systems with ATR requirements. Other program goals include: Significant advances in interactive image exploitation environments and performance; the development of rapid target model construction and rapid ATR updating methods; the development of resource management systems for surveillance and exploitation, and the development and demonstration of ATR-based and single/multiple-scale SAR image formation-based methods for reducing HAE UAV data rates to SATCOM-supportable bandwidths; and the conduct of basic university research into ATR.</p> <p>(U) The goal of the Moving Target Exploitation (MTE) program is to achieve a major advance in computer-assisted tracking and target identification by providing previously unavailable capability to automatically detect, track, and classify high-valued ground-moving targets using all-weather airborne surveillance radar data. Three techniques are being investigated and evaluated: the discrimination of desired targets from other moving vehicles using high range resolution (HRR) moving target indication (MTI) range profiling and 1-D automatic target recognition (ATR); the imaging of specific moving targets via enhanced moving target imaging (MTIm) and inverse synthetic aperture radar (ISAR) processing; and the classification of moving targets using both 1-D and 2-D images and vehicle motion pattern characteristics. Specific applications are targeted for the Joint STARS, U-2, and Global Hawk (Tier II*) platforms.</p>

PE 0603226E, Project EE-50

(U) Program Accomplishments and Plans:

(U) FY 1996 Accomplishments: N/A

(U) FY 1997 Program:

- Complete Foliage Penetration (FOPEN) Concept Development and verify the System Requirements for a FOPEN Airborne Demonstrator radar targeted for a Medium or High Altitude Endurance (MAE/HAE) Unmanned Aerial Vehicle. Complete critical technology demonstration of ultra-wideband antenna design, airborne real-time processing interface, radio-frequency interference suppression, and FOPEN automatic target detection/classification. Develop and prototype Image Exploitation algorithms for FOPEN an EO (HSI/MSI) sensors within the SAIP architecture. Develop a test and evaluation plan with measurement criteria, validation approach and risk assessment matrix by critical technologies to integrate with the DUSD(AT) proposed Counter CC&D ACTD. (\$13.9M)
- Transition of component modules into the SAIP ACTD will be completed and integration continued to achieve enhanced system objectives in continued collaboration with the Defense Airborne Reconnaissance Office (DARO). The site modeling and monitoring component will be integrated, additional Missile Order of Battle and Ground Order of Battle models and algorithms inserted, and the system ported to a High Performance Computer architecture. Tests will be done on system performance with ETRAC and national imagery and the enhanced SAIP system will be available to the Battlefield Awareness and Data Dissemination ACTD (EE-53) to serve as its imagery processor. A military utility evaluation will be conducted with U.S. Atlantic Command. (\$30.4M)
- The MSTAR 10 target recognition system with limited extended operating condition (EOC) capability will be integrated and evaluated, then matured into a 15 target system with increased ROC capability. Transition to SAIP ACTD of MSTAR modules will occur. Concepts and prototypes for interactive exploitation, rapid target insertion and rapid ATR updating will be developed and evaluated. A single scale ATR-based bandwidth compression will be completed and demonstrated in the SAIP exploitation van, and an initial multi-scale compression architecture will be developed and demonstrated in the lab, University research in basic automatic target recognition will continue, with techniques transferring to technology integration programs. (\$16.6M)

Experimental Evaluation of Major
Innovative Technologies,
PE 0603226E, Project EE-50

- The FY 1997 Moving Target Exploitation (MTE) program will complete the integration and evaluation of MTE technology components into the ground-based testbed and will demonstrate non-real-time moving target classification on recorded data. Enhanced tracking capabilities and tools for vehicle motion pattern analysis (MPA) will be added to complete the Phase I MTE testbed. The performance goal of the end-to-end MTE system is to detect and classify high-valued moving Transport Erector Launcher (TEL) targets with a probability of correct classification of 0.9 and associated probability of incorrect classification of 0.05. The MTE program, in coordination with USAF ESC/JS, will record MTE data using the Joint Surveillance, Target, and Attack Radar System (Joint STARS) in FY 1997, and this data will be processed in the ground-based Phase I testbed. In FY 1997, the MTE program will be expanded to include multiple platform operation; the Phase I testbed architecture will be expanded (Phase II) to process Moving Target Imagery (MTIm) data from the U-2 and Global Hawk platforms and to accommodate a more robust target set supporting more comprehensive battlespace awareness. (\$7.2M)

(U)

FY 1998 Program:

- Counter CC&D Program will develop a Foliage Penetration (FOPEN) Airborne Demonstrator radar for test and evaluation on a manned platform, providing inputs via narrowband tactical data links to the image exploitation capabilities in SAIP ground processing facility. The Image Exploitation techniques developed under SAIP will be extended (SAIP++) to include unique characteristics of VHF/UHF band FOPEN radar, high spatial resolution U2 SYERS MSI sensor, and high spectral resolution Predator HSI sensor, and multisensor correlation to improve the reliability of detection and discrimination of tactical targets under camouflage and foliage cover. (\$24.0M)
- Semi-Automated IMINT Processing (SAIP) integration and field testing will continue to achieve transition system objectives and to support U-2 ASARS-2, ASARS-2 upgrades, and Dark Star imagery. Transition to the operational customer, U.S. Atlantic Command, will begin. (\$26.0M)
- The MSTAR 15 target recognition system with increased EOC capability will be integrated and evaluated, then matured into a 20 target system with greater EOC capability. The system then will be fully characterized vs. the defined target set and full EOC dimensions. Transition of the MSTAR system to SAIP and Counter CC&D ACTDs will occur. Full prototypes for interactive exploitation for two analyst missions will be developed and evaluated. A rapid target insertion prototype system will be built and evaluated, creating 5 target models and rapid ATR training systems as a baseline. A resource management prototype will be built and evaluated. Development, integration and demonstrations will continue on a single scale compression and multiple scale bandwidth compression. Airborne and field demonstrations are planned. (\$18.9M)

Experimental Evaluation of Major
Innovative Technologies,
PE 0603226E, Project EE-50

- The FY 1998 MTE program will demonstrate operational, near-real-time MTE performance against high-value moving targets by integrating the Phase I testbed on a Joint STARS platform. In parallel, the Phase II testbed will be completed, and the multiple platform technology components will be integrated and evaluated using simulated and recorded data. A coordinated, joint data collection with Joint STARS and U-2 platforms will be conducted providing instrumented multiple platform MTI data. Non-real-time, multiple-platform tracking, cueing, and moving target classification will be demonstrated using simulated and recorded data. (\$14.3M)

(U) FY 1999 Program:

- Counter CC&D Program will complete Airborne Demonstrator Flight Test and Evaluation on manned platform in conjunction with SAIP ground exploitation capabilities during tactically significant military exercises to verify performance capabilities of ATD/C of tactical targets in CC&D. Initiate integration of FOPEN and Hyperspectral sensors into a Medium or High altitude/endurance (HAE) UAV depending on suitability of sensor and UAV CONOPS. (\$25.0M)
- Complete transition of the SAIP system to OCONUS for military operations. (\$23.3M)
- The evaluation of the MSTAR 20 target/full EOC system will be completed, system technology will be transferred to the SAIP and STARLOS programs, and a two year effort to develop a high performance computing adaptation for an MSTAR real time demonstration system will begin. Development and evaluation of resource management, rapid target insertion, rapid ATR updating and interactive exploitation systems will continue, with key milestones occurring in FY 2000. (\$22.5M)
- The FY 1999 MTE program will finalize the system design for the multiple platform MTE and conduct a joint operational demonstration using the Joint STARS and U-2 platforms. (\$15.0M)

* Related FY 1996 effort performed in projects ST-11 (\$3.5M) and TT-34 (\$11.7M).

(U) **Mission Description:** The objective of this program is to develop critical technologies which enable dispersed units to effectively perform warfighting operations traditionally accomplished with massed forces. With declining resources and a smaller military, the Services must be prepared to quickly project sufficient power to achieve United States objectives rapidly and effectively. The deployment of our forces will be restricted by lift assets and in-theater infrastructure; and they will operate under more complex rules of engagement. Adversaries who are not very powerful may possess sophisticated technology that will place our forces at risk. These risks are increased if our forces are massed to conduct traditional conventional operations. To fight effectively in the future, the Army and Marine Corps are developing concepts of operation (Army - Force XXI and Marine Corps - Sea Dragon) whose tactical implementation will vary, but with similarities that include lighter, more lethal, more flexible forces that are widely dispersed through out the battlefield. The objective is to enable these forces to quickly control a large battlespace with dispersed forces, control the operational tempo, engage enemy targets with remote fire, and operate effectively across the spectrum of conflict and in a variety of environments.

(U) The keys to success for these units are a vastly improved and highly integrated comprehensive awareness system, robust communications, and an integrated, scaleable common grid of the battlespace. While there are many technology developments underway that will assist the Services to accomplish their objectives, at the tactical level there are technology gaps that DARPA will help narrow under the Small Unit Operations program. Technology development efforts will focus on a comprehensive awareness capability that provides real-time, essential information for small units and individual warfighters; wireless communication technologies to permit exchange of voice, digital and video data with other systems; geolocation technologies that provide navigation information in built-up, forested and mountain environments; internetted tactical surveillance and targeting sensors to complement information requirements not satisfied by national, theater, and component sensor programs; and automated tasking and control technologies for air and ground systems. As these technologies mature they will be tested and evaluated. Engineering demonstrations with

<p>*Programs included in this project were previously funded under Project EE-21 and EE-40.</p> <p>(U) <u>Mission Description:</u> This project represents a refocusing and transition of pertinent elements of the Critical Mobile Targets (WAR BREAKER) project (EE-40) and Command and Control Information Systems Project (EE-21) into a concentrated effort to empower the battle commander with comprehensive battlespace awareness. The goal of this project is to take diverse inputs, including those planned as outputs from the Sensors and Exploitation Project (EE-50), and perform distributed and dynamic all-source correlation and fusion to produce an integrated, geospatially referenced, battlefield database and knowledge-base, and through the use of wideband dissemination and integrated sensor management allow multi-site, real-time, collaborative situation assessment and course-of-action evaluations. These goals are being addressed by the Dynamic Multi-User Information Fusion (DMUF) project, the Battlefield Awareness and Data Dissemination (BADD) ACTD and the Airborne Communications Node (ACN) project.</p> <p>(U) Dynamic Multi-User Information Fusion (DMUF) seeks to develop and insert a product line of fusion capabilities that amalgamate and focus diverse sensor observations and rectify disparate fusion products to provide the warfighter with a clear and actionable picture of the battlespace. This system will maintain birth-to-death tracking of high value targets; use distributed, collaborative, dynamic, and all-source correlation, fusion and situation assessment; exploit terrain limitations, enemy doctrine, and first-principle constraints on military operations to construct a hierarchical representation of all battlefield activity; and define a reference architecture to ensure multi-service software reuse and in-field modifiability, full uncertainty accounting, and Global Command and Control System (GCCS) Leading Edge Services (LES) compliance.</p> <p>(U) The Dynamic Database (DDB) program will expand on work begun under DMUF to develop the technology to maintain a Dynamic Situation Model by indexing all relevant information about the battlespace according to geospatial and other attributes, at the entity, terrain, and signal feature level. The database will be able to store selected imagery and annotations, 3D site models, battlefield entities and relations, 1.5D and 2.5D terrain parameter maps, and physical and signal features from imagery and terrain generation applications, all aligned and indexed for rapid, common access. Methods for updating and accessing the Dynamic Situation Model will be provided.</p>

Experimental Evaluation of Major
Innovative Technologies,
PE 0603226E, EE-53

The program will also develop the database services needed by users and applications, including DMIF and BADD, such as change detection, line-of-sight and terrain suitability calculations, trafficability analysis, and real-time generation of current terrain features such as lines of communications.

(U) The objective of the Battlefield Awareness and Data Dissemination (BADD) Advanced Concept Technology Demonstration (ACTD) is to deliver, install and evaluate an operational prototype system that delivers to warfighters a consistent operational picture of the joint/coalition battlefield, allow commanders to design/tailor their own information system, and provides access to key transmission mechanisms and worldwide data repositories. The description of the battlespace provided to the warfighters under this ACTD will be tailored to their mission needs by intelligent selection of information to be broadcast, intelligent processing of user requests (pull) and filtering at the warfighter workstation so that needed information is available. BADD will be evaluated through participation in exercises and demonstrations, and by insertion into ongoing pilot services, such as the Joint Broadcast Service installed in the European Theater in April 1996. EADD is also operating under a Memorandum of Agreement with the Global Broadcast Service Program Office to provide advanced information management capabilities and new applications for this system as part of the overall plan of transition of BADD developments to operations after test and evaluation in the ACTD.

(U) The objective of the Airborne Communications Node (ACN) program is to develop an open architecture, software reconfigurable, communication payload for deployment on the Global Hawk High-Altitude Endurance (HAE) Unmanned Aerial Vehicle (UAV). Global Hawk ACN will provide a self-deployed robust communications infrastructure which will enable range extension relays for line of sight radios and Joint Warfighter communication services for over-the-horizon communications, reachback connectivity to CINCs, high data rate communications to on-the-move users and gateways/bridges to dissimilar radios for seamless communications. The program will conclude with field demonstrations in FY 2000.

<p>(U) FY 1997 Program:</p> <ul style="list-style-type: none"> Dynamic Multi-User Information Fusion (DMUF) program: Develop and demonstrate, with Service transition partners, adaptive fusion processes and services for providing tailored situation representations which facilitate technology insertions and functionality through a broad spectrum of operating environments. Initiate the construction of a simulated test environment for early assessment of user requirements and operational concepts, for performance evaluations and validation of fusion engines, and for easy integration with other developmental and Service information systems. Continue the insertion begun in FY 1996 of DMUF capabilities into the Combined Air Operation Center (CAOC) in Vicenza, Italy. Perform pilot experiments, system performance definition, and entity-level development for a Dynamic Database. Demonstrate a prototype stand alone, multi-source, inference-based fusion system for a limited target set at a major joint operations center, and migrate that system toward an open, agile, and robust architecture to promote interoperability with existing ops/intel battlefield information systems. (\$20.2M) Battlefield Awareness and Data Dissemination (BADP) ACTD: Participate and be evaluated in Task Force XXI Army Warfighting Experiment. Demonstrate system capabilities in a series of demonstrations, including a joint demonstration (called the Joint Forces Integration Demonstration) involving Navy, Marine and Air Force elements. Capabilities and services to be evaluated include: Information Dissemination Manager node located in Washington, DC; Warfighter's Associate terminals in use by the Army and Marines at Fort Irvin, at 29 Palms by the Marines, and at Camp Pendleton/NRA by the Navy and Marines; leased GBS commercial satellite communications interfaces; creation and dissemination of an operational picture of red and blue force status; and dissemination of integrated imagery, video, signals intelligence, terrain, weather, Global Command and Control System (GCCS) and Maneuver Control System (MCS) data. Enhance legacy systems focusing on improving the bandwidth utilization and expanding the user base to include additional major military commands. Efforts during this fiscal year culminate in the delivery of an operational capability supporting CONUS based users and enhancements to the current capability supporting OCONUS users. (\$32.4M) Airborne Communications Node (ACN): Conduct technology development of advanced devices and antennas to facilitate the access of multiple hand held communications devices, start integration of several key enabling technologies (e.g. software radios, common hardware modules and high-speed fiber optic communication infrastructure), develop time, frequency and power management techniques, coupled with traditional EAC/EMI mitigation techniques and antenna design/placement, to enable simultaneous operation across the frequency spectrum from VHF to Ku bands. Initiate subsystem design and development of payload modules. Perform system-level data collections in support of multi-sensor information dissemination. (\$12.3M)

<p>(U) FY 1998 Program:</p> <ul style="list-style-type: none"> DMIF: Continue the development of the DMIF system to include high value target tracking and targeting, hierarchical force assessment, collaborative situation assessment, and direct support to operations and planning applications. Implement the standards and architecture designs needed to create a product line of flexible, open, and distributed battlespace awareness functionality which includes in FY 1998: MTL/multi-track correlator, GOB aggregator/projector, multi-application knowledge representation schemas, dynamic database, and adaptive fusion manager. Transfer entity-level dynamic database capabilities for the FY 1998 initiation of the Dynamic Database program and continue close coordination of these efforts. Demonstrate functionality at multi-service exercise and transition mature components to Service transition partners (Army ASAS/Air Force T3MCS) and DARPA ACTDs (BADD). (\$19.4M) Dynamic Database Program: Expand entity-focused database efforts begun under DMIF by building an integrated prototype for consolidated terrain, signal feature, and entity level representation of a Dynamic Situation Model. Build on algorithms and capabilities previously developed under BADD, Semi-Automated IMINT Processing ACTD (funded under EE-50), Intelligent Integration of Information (funded under ST-11) and especially DMIF, including fusion services, integration of multiple information repositories, change detection and site monitoring, and database mediation, to create a united set of reusable software services that can be mediated for general purpose access by many applications, including DMIF, BADD, and SAIP. Provide an initial test article for integration into the Integrated Sensors Office testbed, and provide a baseline for scalable performance estimates. (\$9.8M) BADD ACTD: Participate and be formally evaluated in an ACOM-conducted joint exercise (Unified Endeavor) increasing the level of automation previously provided to users and extending information management and dissemination support at the level of individual battalions/ships. Provide new information management capabilities to include creation of a 3D graphical depiction of a consistent operational picture by near-real-time integration of all relevant databases, identification and semi-automated resolution of differences. (\$47.0M) ACN: Complete development of advanced device and antenna technology for multiple hand held communications devices and for development of EMC/EMI techniques and antennas that will allow simultaneous operation of radio frequency devices across the spectrum. Complete payload and unique subsystem design. Select and acquire equipment and modules. Fabricate and assemble payload systems and subsystems. Initiate Subsystem Integration and Test. Continue system-level data collections in support of multi-sensor information dissemination and concept-of-operation development. (\$38.2M)

- FY 1998 Increase reflects restructuring of funds to realize the development of key new components for the Dynamic Multi-User Information Fusion (DMIF) Program.
- FY 1999 Increase reflects addition to the Airborne Communications Node (ACN) Program to enable manned aircraft demonstration and begin prototype procurement of Phase III Global Hawk units.

(U) Other Program Funding Summary Cost: N/A

(U) Schedule Profile:

Plan

Milestones

- Oct 96 Demonstrate BADD capability (joint exercise) - Joint Forces Integration Demonstration.
- Mar 97 Support Task Force XXI Advanced Warfighting Experiment.
- Apr 97 Complete definition of ACN antenna design and placement.
- Apr 97 Demonstrate Dynamic Multi-User Information Fusion (DMIF) capability at a major joint operations center.
- Apr 97 Demonstrate BADD capability (Roving Sands '97).
- Jul 97 Deliver DMIF-I to a MAJCOM.

Sep 97 Complete DMIF testbed for system design, concept of operations and human computer interface development.

Oct 97 Demonstrate BADD capability (JWID '97).

Nov 97 Demonstrate DMIF enhanced capability at Division XXI (high value target tracking/projection, hierarchical force assessment).

May 98 Demonstrate DDB prototype in conjunction with ISO testbed.

Jun 98 Complete integration and lab demo of DMIF II and demonstrate interoperability with BADD.

Jul 98 Complete ACN payload design, development, subsystem integration and test.

Jul 98 Support operational exercise OCONUS and CONUS upgrade.

Sep 98 Demonstrate DMIF enhanced capability in joint-level simulation (collaborate situation assessment and operations support).

Sep 98 Deliver BADD pilot service to OCONUS with DMIF baseline capability.

Oct 98 Demonstrate BADD capability (Unified Endeavor 98-1).

Jan 99 Complete demonstration of ACN in systems integration laboratory environment.

<p>(U) Mission Description: The Advanced Electronics Technology program element is budgeted in the Advanced Technology Development Budget Activity because it seeks to design and demonstrate state-of-the-art manufacturing and process technologies for the production of various electronics and microelectronic devices, sensor systems, actuators, and gear drives that have both commercial and military applications. Introduction of advanced product design capability and flexible, scalable manufacturing techniques will enable the commercial sector to rapidly and cost-effectively satisfy military requirements and enhance the U.S. industrial base.</p> <p>(U) The IR Focal Plane Array project focuses on the establishment of a manufacturing capability for advanced infrared sensor arrays for major weapons systems. This industrial base will allow the systems to meet specification requirements at approximately 1% of the current cost.</p> <p>(U) The Electronic Module Technology project is a broad initiative to substantially decrease the cost and increase the performance of weapon systems through the timely insertion of state-of-the-art electronic modules. Electronic module technology addresses the design and fabrication of various types of digital, analog, and mixed signal modules consisting of electronic, electro-optical and micro-mechanical components. It includes traditional approaches such as printed circuit boards and emerging technologies such as high density Multichip Modules (MCMs).</p> <p>(U) The Tactical Information Systems project contains three major programs: Head Mounted Displays (HMD), Smart Modules, and Warfighter Visualization. The Head Mounted Display program is developing world-class miniature displays and integrating these displays into head and helmet mounted configurations for use by pilots, combat vehicle crews</p>

<p>(U) The Microelectromechanical Systems (MEMS) project was previously included in MT-04, the Electronic Module Technology Project. This program is a broad and cross-disciplinary initiative to develop an enabling technology that merges computation with sensing and actuation to realize new systems for both perceiving and controlling weapons systems, processes and battlefield environments. Using fabrication processes and materials similar to those that are used to make microelectronic devices, MEMS conveys the advantages of miniaturization, multiple components, and integrated microelectronics to the design and construction of integrated electromechanical systems. The microfluidic molecular systems program will address issues centered around the development of automated microsystems that integrate biochemical fluid handling capability along with electronics, opto-electronics and chip-based reaction and detection modules to perform tailored analysis sequences for monitoring of environmental conditions, health hazards, and physiological states.</p>

IR Focal Plane Array MT-03	39,493	23,995	9,000	11,000	3,000	0	0	0	0	N/A

(U) Mission Description: The Infrared Focal Plane Array project addresses the technology necessary to produce affordable, infrared (IR) sensor arrays, essential to major weapon systems. The focal plane array consists of a two dimensional detector array sensitive in a broad spectral range, integrated with unique signal processing to enhance performance and provide more efficient utilization of the information. The critical elements of the technology addressed in this program include the infrared material, detector array fabrication, read-out electronics, cryogenic packaging and testing, and module assembly. Processing and fabrication techniques focus on the production of affordable arrays, at low volume, in the configurations required by weapon systems. Performance enhancements in uncooled infrared and near-infrared sensors are also being addressed to provide an integrated, broadband two dimensional sensor array without the cryogenic package usually associated with infrared sensors. Elimination of the cryogenic package dramatically reduces the cost of the sensor module, and provides a sensor package compatible with a wide range of system applications, including navigation, targeting and manportable systems. The solid state integrated sensor also solves the problem of blooming in the presence of high intensity sources, which is encountered with current low light level visible and near infrared sensors. Arrays will be built in the configuration required for missile seekers; target acquisition and navigational platforms; search and track; and threat warning systems.

(U) Program Accomplishments and Plans:(U) FY 1996 Accomplishments:

- Completed development of standard electronic cells for rapid design and fabrication of infrared read-out circuits. (\$9.0M)
- Demonstrated uncooled focal plane arrays hybridized to low noise analog readout circuits. (\$5.0M)
- Demonstrated focal plane array fabrication using four inch diameter silicon wafers. (\$14.0M)
- Verified computer aided design tool for infrared sensors; including cryogenic packaging. (\$11.5M)

(U) FY 1997 Program:

- Complete single-wafer IRFPA processing on six inch silicon wafers. (\$6.0M)
- Demonstrate capability to fabricate uncooled infrared sensor with one million pixels. (\$5.5M)
- Assess capability to fabricate thin film ferroelectric uncooled infrared sensor. (\$4.0M)
- Evaluate imaging performance and anti-blooming of uncooled solid state sensor. (\$8.5M)

RDT&E BUDGET ITEM JUSTIFICATION SHEET (R-2 Exhibit)										DATE	September 1996
APPROPRIATION/BUDGET ACTIVITY					R-1 ITEM NOMENCLATURE						
RDT&E, Defensewide					Advanced Electronics Technologies,						
BA 3 Advanced Technology Development					PE 0603739E						
COST (In Thousands)	FY 1996	FY 1997	FY 1998	FY 1999	FY 2000	FY 2001	FY 2002	FY 2003	Cost to Complete	Total Cost	
Electronic Module Technology MT-04	93,376	62,377	62,006	94,090	125,160	125,312	127,240	132,425	Continuing	Continuing	

(U) **Mission Description:** The Electronic Module Technology Project is a broad initiative to substantially decrease the cost and increase the performance of weapon systems through the timely insertion of state-of-the-art electronic modules. Electronic module technology addresses the design and fabrication of various types of digital, analog, and mixed signal modules consisting of electronic, electro-optical and micro-mechanical components. It includes traditional approaches such as printed circuit boards and emerging technologies such as high density Multichip Modules (MCMs).

(U) The project has four major objectives: (1) shorten the overall design, manufacture, test, and insertion cycle for advanced electronic subsystems; (2) advance the state-of-the-art in electronic interconnection and physical packaging technology to allow circuits to operate close to their intrinsic maximum speed with less overhead in terms of volume, weight and cost; (3) provide a robust manufacturing infrastructure for electronic modules; and (4) demonstrate the system level payoff of electronic module technology through advanced technology demonstrators (ATDs).

(U) The project has the following major elements: Application Specific Electronic Modules (ASEM); Multichip Integration (MCI); Rapid Prototyping of Application Specific Signal Processors (RASSP); Optical Micro-Networks (OMNET); Cooperative Adaptive Payloads (CAPS); Infrared Artificial Dielectrics (IRADS); and Design Support for mixed Technology Integration (Composite CAD). ASEM will reduce the non-recurring engineering time and cost for designing and inserting complex electronic modules. MCI will produce order of magnitude reductions in manufacturing cost and accelerate the acceptance and insertion of Multichip Integration technologies. RASSP is a major DARPA/tri-Service initiative which seeks to dramatically reduce the development time and life cycle cost of advanced signal processing capability. OMNET seeks to demonstrate new paradigms for integrating electronic, electromechanical, and electro-optical components to enable small, lightweight, battlefield information systems. CAPS is a new effort to integrate developments in MEMS, power sources, communications, and advanced microelectronics to design, construct and field multiple, high-performance, mobile, autonomous systems. Composite CAD seeks to enable the design of systems incorporating emerging micro-devices and manufacturing processes by developing the design technology (tools, methodology, and architectures) to support device and systems design of mixed-technology integrated systems.

<p>(U) <u>Program Accomplishments and Plans:</u></p> <p>(U) <u>FY 1996 Accomplishments:</u></p> <ul style="list-style-type: none"> Completed development of required microwave packaging approaches and interconnection circuitry; produced and demonstrated required multichip microwave assemblies. (\$10.0M) Demonstrated complete end-to-end Rapid Prototyping of Application Specific Signal Processors (RASSP) design framework with additional demonstration hardware and benchmark evaluations. Developed accelerated framework standards, improved Computer Aided Design (CAD) technology for system testing, and reuse libraries. Accelerated technology transfer activities. (\$32.2M) Continued Application Specific Electronic Modules (ASEM) program to reach one month turn-around time and \$25K non-recurring engineering (NRE) cost for digital Multichip Modules (MCMs). Demonstrated high volume production technology for producing known-good die. (\$19.6M) Continued Multichip Integration (MCI) program with the delivery of high volume/low cost laminate MCM technology and develop optimized modules and mixed signal applications. (\$20.1M) Expanded the current effort in Seamless High Off-Chip Connectivity (SHOCC) to include a full scale demonstration of a high-performance microprocessor. This demonstration segmented the integrated circuit design into yield and performance-optimized active elements, fabricated these elements and assembled a fully-functional device on a passive substrate incorporating traces formerly within the chip. Mating of the active die to the substrate was through a high-density interposer. (\$10.0M) Reprioritized design activities to focus on enabling highly integrated mixed-technology electronic systems which include digital, analog, MEMS and optics devices. (\$1.5M) <p>(U) <u>FY 1997 Program:</u></p> <ul style="list-style-type: none"> Complete and demonstrate final end-to-end RASSP signal processor design environment. Complete technology insertion demonstrations, benchmarking analysis, and technology transition activities. (\$7.5M) Continue ASEM technology development and demonstrate new ASEM foundry capability for flexible production of modules with board-level integration. (\$11.8M) Continue Multichip Integration program to demonstrate order of magnitude reductions in MCM manufacturing costs and MCM technology insertions. Continue insertion of MCM technology into dual-use products such as workstations, engine control and wireless communications. (\$22.6M) Initiate OMNET program to demonstrate new paradigms for integrating electronic, electromechanical, and electro-optical components to enable small, lightweight, battlefield information systems. (\$11.5M)

(U) Mission Description: This project is a major DoD effort to develop the technology for displays and portable information systems for use in a variety of military systems. The project has three major programs: Head Mounted Displays (HMDs), Smart Modules, and Warfighter Visualization. The Head Mounted Display program is developing world-class miniature displays and integrating these displays into head and helmet mounted configurations for use by pilots, combat vehicle crews and individual warriors as well as for virtual environments and simulation. Smart Modules is a program to design and develop prototype modules, using core technologies that sense, think, and communicate, and integrate them into selected personal information products. Warfighter Visualization is a program to demonstrate the feasibility of combining real-time visual images of the environment with geospatially registered computer generated information for use by individual mounted and dismounted warfighters.

(U) Program Accomplishments and Plans:

(U) FY 1996 Accomplishments:

- Head Mounted Displays. (\$10.1M)
 - Completed all on-going miniature display efforts and initiated feasibility demonstrations for miniature diffraction grating displays and Microelectromechanical Systems (MEMS) based displays.
 - Smart Modules. (\$10.6M)
 - Demonstrated four systems for use by individuals remotely located from conventional information sources. Initiated developments to demonstrate individually worn direction finding and video capture capability.

(U) FY 1997 Program:

- Head Mounted Displays. (\$5.9M)
 - Demonstrate feasibility of diffraction grating and MEMS based miniature displays. Diffraction grating displays will integrate drivers, standard interfaces, memory and controller circuitry directly on the display. This will improve the range of applications for which the display can be applied and significantly reduce power consumption requirements. The MEMS display will use a novel micro-beam steering device to control the movement of a fiber optic to scan a mirror with an image. This type of display will greatly reduce the head-borne weight to a few ounces and significantly reduce power consumption over currently available displays.

<ul style="list-style-type: none"> • Smart Modules <ul style="list-style-type: none"> - Demonstrate the feasibility of combining computation, wireless communicating capability, and high resolution display in a paper sized device operating on commercially available batteries. Device will be built using shape deposition manufacturing processes to demonstrate rapid, cost-effective prototyping. The device will be used to receive text, graphics and video and provide limited transmitting capability. Demonstrate electronic information capability integrated into soldier's clothing. A soldier's vest will incorporate computers, GPS, radio, batteries and PC card slots for various peripherals. First demonstration will be for Army maintenance application. (\$15.2M) • Warfighter Visualization <ul style="list-style-type: none"> - Initiate efforts to develop technologies that will allow tracking of hand and head motion for mobile, untethered individuals. (\$4.0M) 			
(U) <u>FY 1998 Program:</u> <ul style="list-style-type: none"> • Smart Modules <ul style="list-style-type: none"> - Demonstrate prototype electric countermeasures system integrated into a soldier worn vest. The computational capability developed in the FY 1997 program will be augmented with two PC cards containing ECM circuitry and will allow dismounted soldiers to instantly locate radio emissions from hostile forces. Demonstrate a prototype water proof computer for underwater use in SEAL and Explosive Ordnance Disposal applications. (\$15.3M) - Demonstrate prototype inertial navigation device integrated into soldier boots. This device will use miniature accelerometers and gyros to measure direction and distance traveled. It will be used to augment GPS navigation when the user is in areas where satellite reception is unavailable. (\$6.0M) • Warfighter Visualization <ul style="list-style-type: none"> - Continue efforts to develop hand and head motion tracking technologies. Tracking head movement will allow a computer to display information to a head mounted display that is registered in the geospatial direction that the individual is looking. Tracking hand motion will allow a computer to recognize pointing and gestures as input mechanisms instead of using a keyboard. (\$6.3M) - Demonstrate image capture and geospatial registration of icons on terrain in a moving vehicle. The vehicle will be equipped with video cameras that provide a 360 degree view. Inside the vehicle, a person wearing a head tracked, head mounted display will be able to look around and view the images obtained from the cameras. Icons and graphical images generated by a computer will be overlaid on the camera image in the head mounted display. These images will be registered with the viewed real-world terrain. (\$7.3M)

<p>(U) FY 1999 Program:</p> <ul style="list-style-type: none"> • Smart Modules <ul style="list-style-type: none"> - Demonstrate a novel capture device that incorporates signal and data processing in a 3-D package for use by individual soldiers. This miniature device weighing only a few ounces will be able to capture an image and rapidly analyze movement or correlate images with all processing done on the focal plane. The camera will be able to be worn by individual soldiers and communicate via a radio to and from geographic information system data bases. (\$9.2M) - Demonstrate a wearable computer incorporating wireless communication in a one pound, one watt configuration. This represents a 3x improvement in weight and a 10x improvement in power over current technology. The wearable computer will be used in a wide variety of applications by the small unit operations soldier. (\$9.0M) • Warfighter Visualization <ul style="list-style-type: none"> - Demonstrate prototype capability for dismounted soldiers to view real world with overlaid graphic symbology. This capability will allow the soldier to receive visual information that is relevant to his/her mission time or location. It will also allow the soldier to interrogate databases containing information about the specific objects in his/her viewing environment. (\$5.8M) - Demonstrate prototype "see-through" tank concept. This capability will allow a "buttoned-up" tank crew wearing head mounted displays to view the outside world as though the tank were made of glass. This will be accomplished by placing cameras on the outside of the tank that provide inputs to a mapped memory. Images will be fed to the users head mounted display depending upon the direction that the user is looking. This capability will significantly enhance the situation awareness of the tank crew. (\$6.5M) - Demonstrate a capability to obtain one-dimensional and two-dimensional data from a submarine sensor suite and configure these data into a 3-dimensional image covering 360 degrees that is provided to a head-tracked, head mounted display. This capability will be used by a submarine conning officer to demonstrate an enhanced capability for under ice submarine navigation. (\$5.1M)

(U) Mission Description: Microwave and millimeter wave technology for DoD electronic weapon systems is at a critical crossroads. Great progress has been made under the microwave and millimeter wave integrated circuit (MIMIC) program in terms of maturing the gallium arsenide industrial community. The DoD is now far ahead of the commercial world in microwave and millimeter wave technology in terms of performance characteristics. However, in many cases, radio frequency (RF) sub-system costs are still a major impediment to fielding DoD weapon systems. Material, processes and design technology advances must be undertaken to sustain an effective defense capability and to maintain U.S. dominance in this critical technology area. The Microwave and Analog Front End Technology (MAFET) program is the only DoD effort directed at significantly reducing non-recurring costs for military microwave/millimeter wave sensor systems through improved computer aided design capabilities and advanced technologies. It will provide urgently needed improvements in the performance and affordability of microwave and millimeter wave components. The MAFET program addresses the essential foundation for all DoD systems and programs making use of microwave and millimeter wave solid state technology.

(U) Specifically, the MAFET program will provide the DoD with the state-of-the-art electronic systems that it needs to maintain its force multiplying capability. The program will: (1) reduce design time and cost for every RF system being developed or upgraded through an improved microwave/millimeter wave design environment; (2) break the very expensive cycle and time-consuming current practice of design-build-test--redesign-rebuild-retest; (3) put in place repeatable, robust processes to produce high frequency components; (4) make strategic investments in critical passive, packaging and integrated circuits devices needed for millimeter wave systems; and (5) investigate revolutionary solutions to the long-standing problem of insufficient power in solid-state radar and communications transmitters.

(U) Program Accomplishments and Plans:

(U) FY 1996 Accomplishments:

- Continued development and implementation of microwave/millimeter wave computer aided design (CAD) environment with quantitative demonstration of ability to reduce time and cost of producing microwave and

(U) FY 1998 Program:

- Complete microwave/millimeter wave computer aided design environment. Demonstrate design environment effectiveness. Continue implementation of Microwave Hardware Description Language (MHDL). (\$8.2M)
- Complete advanced sensor technology developments in the areas of: advanced fabrication, packaging, and multichip assembly (MCA) foundries. In the fabrication area, demonstrate: (1) production InP HEMT and HBT millimeter wave processes; (2) advanced manufacturing processes for: high power and high efficiency, high dynamic range, and mixed signal capability; and (3) highly manufacturable and reliable HBT high power amplifiers. In the packaging area, demonstrate: (1) a 10x cost reduction in plastic HDI module fabrication technology; and (2) a 7x volume efficiency increase due to embedded transmission lines and advanced multilayer interconnect. In the foundry area, demonstrate a 5x reduction in MCA production cost. (\$8.6M)
- Demonstrate all-solid-state X-band source with 100-W output. (\$6.5M)
- Demonstrate all-solid-state quasioptical Ka-band source with 10-W output. (\$7.2M)
- Integrate MEMS phase shifter with power amplifiers to make highly efficient X-band T-R modules. (\$4.0M)
- Demonstrate MEMS-based beam steering array at frequencies above 30 GHz. (\$3.6M)
- Demonstrate all-solid-state W-band source with 1-W output. (\$5.0M)

(U) FY 1999 Program:

- Insert and validate performance of 100-W X-band source in fielded ground-based, airborne or similar radar platform. (\$11.5M)
- Insert and validate performance of MEMS-based T-R modules. (\$4.0M)
- Demonstrate millimeter wave 10-W all-solid-state quasioptical power in laboratory system or sub-systems. (\$10.0M)
- Demonstrate millimeter wave MEMS-based beam steerer as replacement to gimbal-mounted mirror in laboratory missile-seeker subsystem. (\$4.0M)
- Initiate high efficiency, low power, RF-analog merged process and circuit development efforts to achieve major advances in the cost, size, weight, and power of sensor electronics for space-limited platforms and man-portable systems. (\$9.5M)

(U) Mission Description: Future military systems will be affordable only if the manufacturing process is considered as an integral part of product design, production takes place in flexible, multi-product factories, and if advanced manufacturing technology is combined effectively with advanced business practices. This program focuses on demonstrations of process technology combined with innovative industrial practices, and will measure the improvements in cost, schedule and quality achievable in key defense product areas. Three major initiatives are included in the FY 1996-2000 program: Affordable Multi-Missile Manufacturing (AM3); Agile Manufacturing Pilot Programs; and the DARPA/Tri-Service Flexible Interferometric Fiber Optic Gyroscope (IFOG) Manufacturability Program.

(U) The Affordable Multi-Missile Manufacturing (AM3) program is an Advanced Technology Demonstration initiated in FY 1995. The objective of AM3 is to demonstrate the feasibility of 25-50% reductions in the unit cost of tactical missiles, both in ongoing missile production programs and in new missiles and major modifications. This will be accomplished by teams of missile prime contractors, component suppliers and manufacturing equipment and software vendors who develop and demonstrate the combined effects of advanced design, manufacturing, assembly systems and processes, missile value engineering changes, and acquisition reform and business practice innovations. A major technical theme is to achieve economies across a mix of missiles to compensate for the decline in individual missile quantities. Demonstrations will be conducted in the design and manufacture of components and guidance and control/seeker assemblies for multiple missiles, including R&D and production programs.

(U) Agile Manufacturing is an industry-developed vision for 21st century manufacturing, which focuses on the ability to thrive in an environment of changing product technologies, customer demands, and development and production team members. This new paradigm is ideally suited to the needs of defense manufacturing in the future. Agile Manufacturing Pilot Programs are structured to evaluate the manufacturing enterprise concepts and enabling technology required for agility on and above the factory floor. Since over 50% of the cost of weapon systems is attributable to components from lower tier suppliers, the major emphasis is on tightly integrating the supplier chain and other elements of the manufacturing enterprise.

(U) Interferometric Fiber Optic Gyroscopes (IFOG) are emerging as preferred technology for future military and commercial inertial navigation applications.

RDT&E BUDGET ITEM JUSTIFICATION SHEET (R-2 Exhibit)		DATE	September 1996

BA 3 Advanced Technology Development		PE 0603739E, Project MT-08	

The emphasis of the IFOG Manufacturability Program is on achieving the design and manufacturing flexibility required to make low volume Defense components economically viable when compared to high volume commercial production. This program will develop the large through put robotic assembly, packaging and testing technologies necessary to fabricate navigation-grade (0.01 deg/hr) Interferometric Fiber Optic Gyroscopes (IFOGs) at less than \$1,500 per axis as a goal. This will enable affordable, accurate (1nm/hr) inertial navigators for use during extended periods of Global Positioning System (GPS) signal outage due to enemy jamming. Flexible manufacturability enables, from the same production line, fabrication of navigation grade, military tactical grade (0.1 - 1.0 deg/hr) IFOGs and lower performing (> 1 deg/hr) commercial IFOGs. Example technology development areas include: (1) low loss, low reflectivity, polarization-preserving optical connections between optical fiber subassemblies, optical sources, detectors and miniature integrated optical circuits; (2) rapid, precision coil winding machines; (3) geometrically stable, environmentally robust (temperature and vibration) packaging of critical optical subassemblies; and (4) automatic testing machines. Phase 1 will identify IFOG manufacturing process requirements for components, subassemblies and complete IFOG units. Phase 2 will demonstrate advanced manufacturing methods, controls and equipment. Phase 3 establishes and demonstrates a prototype automated, flexible IFOG manufacturing facility, transitioning the manufacturing processes and controls from Phase 2.

(U) Program Accomplishments and Plans:

(U) FY 1996 Accomplishments:

- Affordable Multi-Missile Manufacturing (AM3). (\$23.7M)
 - Completed Affordable Multi-Missile Manufacturing (AM3) Phase 1, approved validation plans, and initiated Phase 2 demonstrations to assess and mitigate risks, including simulation and modeling, design and component-level manufacturing demonstrations, and qualification testing.
 - Competitively selected two system vendors for the development of supply chain integration technologies to fill gaps identified in AM3 Phase 1.
 - Continued AM3 technical integration activities, conducted independent evaluation of contractor cost savings analyses and completed initial set of benchmark comparison studies for the missile sector.
- Agile Manufacturing Program. (\$16.4M)
 - Completed Agile Manufacturing business practice demonstrations and documentation, inserted results in Pilot Program testbeds, and disseminated results for DoD and industry implementation.
 - Completed Agile Manufacturing enabling technology demonstrations, initiated beta test in Pilot Programs, and transferred technology through the Industry Forum and through vendor products.
 - Completed Agile Manufacturing pilot programs in space launch vehicles and castings.

Advanced Lithography MT-10	57,509	51,404	40,000	40,000	40,000	40,000	37,500	35,754	Continuing	Continuing

(U) Mission Description: Lithography technology has enabled the dramatic growth in microelectronics capability over the past three decades and microelectronics is a key to improved weapon system performance. The improved capabilities in semiconductor technology contribute to significant system gains in speed, reliability, cost, power consumption, and weight. Advanced microelectronics technology is essential for computing and signal processing throughout essentially all military systems, including command, control, communications, and intelligence, electronic warfare, and beam forming for radar and sonar. Further improvements in areas such as target recognition, autonomous guided missiles, and digital battlefield applications require microcircuits with smaller features to meet the operational speed, power, weight and volume constraints of these systems.

(U) Current microelectronics fabrication utilizes feature sizes of 0.35 microns. The Advanced Lithography Program emphasizes longer term research with expected high payoff in the fabrication of semiconductor devices with 0.1 or less micron feature sizes. These programs will develop technology for sub 0.1 micron features. Current programs in cross-cutting technologies (mask, stages, resists, metrology) and x-ray lithography will be completed in one - two years. The projection e-beam developments will demonstrate alpha tool versions late in the decade.

(U) Program Accomplishments and Plans:

(U) FY 1996 Accomplishments:

- Demonstrated prototype projection electron-beam and ion-beam lithography lenses. (\$10.0M)
- Demonstrated processing using x-ray lithography and point source development. (\$23.0M)
- Developed alignment sub-assemblies and mask technology for 0.18 micron lithography system. (\$13.1M)
- Developed key subsystems for a point source x-ray lithography system. (\$11.4M)

(U) FY 1997 Program:

- Demonstrate stage control for lithography tools with 0.13 micron capability. (\$6.0M)
- Demonstrate breadboard subsystems of electron-beam projection lithography systems. (\$14.0M)
- Fabricate devices and x-ray sources for 0.13 micron design rules. (\$25.0M)
- Improve e-beam writing, inspect, repair, and processing for 0.12 mask capability. (\$6.4M)

<p>(U) Mission Description: The Microelectromechanical Systems (MEMS) program is a broad, cross-disciplinary initiative to develop an enabling technology that merges computation with sensing and actuation to realize new systems for both perceiving and controlling weapons systems, processes and battlefield environments. Using fabrication processes and materials similar to those that are used to make microelectronic devices, MEMS conveys the advantages of miniaturization, multiple components, and integrated microelectronics to the design and construction of integrated electromechanical systems. The MEMS program addresses issues ranging from the scaling of devices and physical forces to new organization and control strategies for distributed, high-density arrays of sensors and actuator elements. The microfluidic molecular systems program will address issues centered around the development of automated microsystems that integrate biochemical fluid handling capability along with electronics, opto-electronics and chip-based reaction and detection modules to perform tailored analysis sequences for monitoring of environmental conditions, health hazards, and physiological states.</p> <p>(U) The MEMS program has three principal objectives: The realization of advanced devices and systems concepts; the development and insertion of MEMS products into DoD systems; and the creation of support and access technologies to catalyze a MEMS technology infrastructure. These three objectives cut across a number of focus application areas to create revolutionary military capabilities, make high-end functionality affordable to low-end systems, and extend the operational performance and lifetimes of existing weapons platforms. The major technical focus areas for the MEMS program are: 1) inertial measurement; 2) fluid sensing and control; 3) electromagnetic and optical beam steering; 4) mass data storage; 5) chemical reactions on chip; 6) electromechanical signal processing; 7) active structural control; 8) analytical instruments; and 9) distributed networks of sensors and actuators.</p> <p>(U) Accomplishments to date include: A wind-tunnel test of an integrated MEMS sensor and actuator array distributed along the leading edge of a model aircraft wing creating rolling moments of sufficient strength to control aircraft flight, pointing the way to future fighter aircraft with advanced maneuverability unattainable using conventional, large and discrete control surfaces; a demonstration of a MEMS-based accelerometer capable of surviving and operating in the near 100,000 G accelerations generated by firing artillery shells, making possible affordable guidance systems to what are presently unguided munitions and increasing both their effectiveness and life cycle costs; and the establishment of a regularly scheduled,</p>

shared, MEMS fabrication service for domestic DoD, commercial and academic users. The service has lowered barriers to access and has allowed hundreds of researchers, students and industrial users, nearly half for the first time, to inexpensively and rapidly fabricate MEMS devices.

(U) Program Accomplishments and Plans:(U) FY 1996 Accomplishments:

- Achieved factor of 3-5x increase in electronics-to-mechanics integration ratios with new fabrication processes; began development of related information-driven and fault-tolerant designs for devices; began incorporation of extreme condition materials into sensor and actuator designs. (\$6.9M)
- Achieved 200-300 mechanical components/sq. cm systems densities with associated increases in both process yields and device performance uniformities; began exploration of new organization and control strategies for multiple, heterogeneous and distributed MEMS components; continued development of complete and stressing MEMS systems demonstration projects in areas such as fluid vortex control, adaptive optics, combustion control and atomic-resolution mass-data storage. (\$16.7M)
- Extended distributed shared fabrication services to enable process experimentation; continued development of fabrication, packaging and metrology tools to address devices and systems developments; expanded available set of shared fabrication processes and associated CAD tools and design libraries. (\$7.1M)

(U) FY 1997 Program:

- Achieve additional factor of 5-10x increase in electronics-to-mechanics integration ratios; explore space of related device designs and architectures enabled by order-of-magnitude increase in integration ratios including electromechanical signal processing elements and radio-frequency components; continue development of fault-tolerant and parallel designs including low-noise, low-drift multi-axis accelerometers and gyroscopes; demonstration of extreme temperature and pressure sensor function in operational environments. (\$10.7M)
- Achieve 400-500 mechanical components/sq. cm systems densities with integrated or hybrid fabrication/assembly techniques; demonstrate MEMS applications using massively parallel MEMS components; initiate new dual-use areas including analytical instruments, precision assembly, on-demand structural strength enhancement and air-vehicle aerodynamic control; begin creation of shared testbed for development and validation of new organizational and control strategies for large-scale, distributed MEMS. (\$24.8M)

BA 5 Advanced Technology Development

- Begin transition of mature fabrication services to self-sufficiency; demonstrate scalable distributed fabrication services for MEMS process experimentation; continue development of MEMS-specific unit processes and associated processing equipment; continue the extension of simulators to address the modeling and coupling of multiple physical forces encountered in MEMS applications; continue dissemination and validation of CAD tools and design libraries. (\$8.3M)
- Initiate plans to develop on-chip integrated microfluidic systems for improved detection and control of molecular reactions with emphasis on the development of new materials and control of reactions. (\$14.0M)

(U) FY 1998 Program:

- Accelerate and expand on MEMS systems developments that; (1) exploit physics and MEMS systems architecture to project micro scale actions into macro scale effects, (2) extend present fabrication processes to cost-effective, large-area fabrication approaches, and (3) integrate developments in MEMS, robotics and ultra-electronics to design, construct and field multiple, high-performance, mobile, autonomous systems. (\$54.1M)
- Initiate system-level integration through an evolving testbed strategy in which the development of new microfluidic components and processes occurs concurrently with the integration of early prototypes with available chip-based molecular analysis components. Leverage analysis and detection technology from industry, Services, and other DoD programs when compatible with microsystems integration. (\$16.0M)

(U) FY 1999 Program:

- Initiate concept demonstrations for systems in the form of model aircraft and weight-supporting structures, and additional concepts in areas including identify friend-or-foe systems, on-chip chemical processing, and mobility. Address the key barriers in MEMS fabrication, packaging and integration to realizing systems demonstrations that will be critical to DoD validation and insertion of MEMS technology. (\$55.5M)
- Continue system-level integration on new microfluidic components and processes. (\$16.0M)

Shipbuilding Technology MR-01	46,351	37,408	50,000	0	0	0	0	0	0	N/A

(U) Mission Description: The goal of the MARITECH program is to preserve the U.S. shipbuilding industrial base by improving the industry's commercial competitiveness through advanced technology applications. For the Defense Department, a competitive shipbuilding industry optimizes Navy ship acquisition reform and allows realization of the Department's objective for affordable Navy ships. The goal of the DoD Acquisition Reform Program is to take advantage of the best commercial practices of industry and thereby achieve cost reductions of the ships and systems it purchases. Having operated exclusively in a protected domestic market, the U.S. shipbuilding industry has not implemented the best commercial processes necessary to compete in the international arena or to build affordable Navy ships. The government's attempt at acquisition reform, as it applies to ship acquisition, could fall short if U.S. shipyards are not commercially competitive. The key for acquisition reform is for the U.S. shipbuilding industry to attain global commercial competitiveness.

(U) This is a two-phased program that provides products and infrastructure for the near and far term. The near term effort enhances international competitiveness through the development of a portfolio of U.S. ship designs for the international marketplace and the build strategies for their competitive price and delivery. This effort is being enhanced by developing an infrastructure that includes the implementation of electronic communications and commerce throughout the industry, and by participating in an industry-wide forum for problem solving on a technical level.

(U) The long term effort includes the infusion of innovative product technologies and process improvements that brings the capabilities of the U.S. shipbuilding industry above those of foreign shipyards. This will result in a larger share of the international market, and a self-sustaining, highly efficient U.S. shipbuilding industry.

(U) Program Accomplishments and Plans:

(U) FY 1996 Accomplishments:

- Completed all shipbuilding strategy development initiatives and new ship designs begun in prior years. (\$13.5M)
- Completed advanced technology development initiatives started in FY 1995. (\$8.2M)
- Established a National Shipbuilding Consortium. (\$.6M)

(U) Change Summary Explanation:

FY 1996 Decrease due to inflation savings cited on reprogramming actions (\$-.9 million) and transfer to the SBIR program element (\$-.8 million).

(U) Other Program Funding Summary Cost: N/A

(U) Schedule Profile:

Plan Milestones

Apr 96 Commenced new initiative for Advanced Technologies to radically improve ship construction processes in the U.S. to surpass foreign competition.

Sep 96 Complete development of 19 new ship designs for the international commercial marketplace along with strategies for competitive construction.

Sep 97 Complete development of 15 process and product technological innovations focused on aiding the U.S. shipbuilding community to compete internationally.

Sep 97 Complete 2 additional ship designs for the international commercial marketplace.

Nov 97 Complete evaluation of Integrated Product Data Environment for Shipbuilding.

Feb 98 Complete test and evaluation of System Life Cycle Support Infrastructure Demonstration Project.

Sep 99 Complete development of commercialization plan for next Generation Windows based system for Integrated Product and Process Development.

Dec 99 Complete development of National Shipbuilding Information Infrastructure Protocols.

APPROPRIATION/BUDGET ACTIVITY			R-1 ITEM NOMENCLATURE								
RDT&E, Defensewide			Joint Strike Fighter Program,								
BA 3 Advanced Technology Development			PE 0603800E								
COST (In Thousands)	FY 1996	FY 1997	FY 1998	FY 1999	FY 2000	FY 2001	FY 2002	FY 2003	Cost to Complete	Total Cost	
Joint Strike Fighter Program JA-01	28,917	78,400	23,900	0	0	0	0	0	0	N/A	
<p>(U) <u>Mission Description:</u> The Joint Strike Fighter (JSF) Program is the focal point for defining affordable next generation strike aircraft weapon systems for the USN, USMC, USAF, and allies. Program emphasis is on facilitating the evolution of fully validated and affordable joint operational requirements, and demonstrating cost leveraging technologies and concepts to lower risk prior to entering engineering and manufacturing development (E&MD) of the JSF in FY 2001. The JSF Program is a joint program with no executive Service. Beginning in FY 1995, the Navy and Air Force each provide approximately equal shares of annual program funding. DARPA's Advanced Short Take Off Vertical Landing (ASTOVL)/Conventional Take Off and Landing (CTOL) Common Affordable Lightweight Fighter (CALF) project (previously known as ASTOVL) was integrated with the JSF program by FY 1995 legislation. DARPA contributed funding for the JSF Program in FY 1996 under this new program element. The US/UK international collaborative CALF Program conceived by DARPA was investigating a revolutionary approach for melding advanced technology, multi-service commonality, and improved business practices directed toward demonstrating an affordable, capable replacement for the F-16, F/A-18, and AV-8B. DARPA is bringing this insight and experience to bear in integrating the structure and philosophy of the CALF program within the JSF framework. The DARPA program manager now is serving as a Director within the JSF program organization. This ensures that DARPA's expertise in ASTOVL technologies, streamlined acquisition, and rapid prototyping are brought to bear in the JSF technology demonstration program.</p> <p>(U) <u>Program Accomplishments and Plans:</u></p> <p>(U) <u>FY 1996 Accomplishments:</u></p> <ul style="list-style-type: none"> • Completed critical technology validation program for the Direct Lift and Shaft Coupled Lift Fan Concepts. (\$7.4M) • Commenced Preliminary Demonstration Design Propulsion and JSF Competitive Engine efforts. (\$18.3M) • Commenced concept definition and design research for weapon system concept for a tri-service family of aircraft. (\$3.2M) <p>(U) <u>FY 1997 Program:</u></p> <ul style="list-style-type: none"> • Commence Joint Strike Fighter Concept demonstration phase, including ground and flight demonstrations and concept refinement for the tri-service family of aircraft. (\$78.4M)

RDT&E BUDGET ITEM JUSTIFICATION SHEET (R-2 Exhibit)										DATE	September 1996
APPROPRIATION/BUDGET ACTIVITY		R-1 ITEM NOMENCLATURE									
RDT&E, Defensewide		Dual Use Applications Program,									
BA 3 Advanced Technology Development		PE 0603805E									
COST (In Thousands)	FY 1996	FY 1997	FY 1998	FY 1999	FY 2000	FY 2001	FY 2002	FY 2003	Cost to Complete	Total Cost	
	0	250,000	195,000	175,000	145,000	75,000	0	0	0	N/A	
Dual Use Applications Programs GC-01											
<p>(U) Mission Description: The Dual Use Applications Program (DUAP) will introduce dual use R&D approaches into the Military Services as a new norm by developing dual use technologies, i.e. technologies that are militarily useful and commercially viable, for the direct benefit of Military users. Building on previous experience, the DUAP will help embed this new way of doing business throughout the Military Services by familiarizing a cadre of people who understand and accept the concept through real experience with it. DUAP is a joint program of the three Military Departments, DARPA, and DDR&E; the Service S&T executives are committed to using DUAP to both develop technology and spread dual use R&D more deeply into their departments.</p> <p>(U) Dual use R&D improves the DoD's access to some of the most affordable, advanced technology -- technology created and sustained in the dynamic and growing commercial sector. The key to dual use is actively, intentionally leveraging the commercial sector's research, products, and processes for the benefit of the DoD. By its nature, this is an entrepreneurial activity that requires foregoing many of the rules, regulations, and procedures typically required in traditional DoD research and development activities. While experience has shown that dual use R&D is practical, it has also shown that it is unfamiliar to many and has not been widely adopted. DoD's current challenge is to spread dual use R&D more deeply throughout the Department and "normalize" it.</p> <p>(U) DUAP's pool of R&D funds will create an incentive and opportunity for Service program managers to fund new technology using a dual use approach under the tutelage of senior personnel experienced with the unique acquisition requirements of dual use programs. R&D projects will be solicited as government/industry partnerships, selected to meet Service needs, and managed by the Services using new authorities and methods. Each project will include, up front, a clear path for the technology to be used in a military system. As a joint program, DUAP is a unique forum for all the Services to simultaneously refine and share what they learn about dual use R&D while working on technologies of joint interest.</p> <p>(U) DUAP is managed by the Joint Dual Use Program Office (JDUPO). JDUPO is led by DARPA during FY 1997. Beginning with FY 1998, DUAP will transition to the Military Departments under the direction of the DDR&E.</p>

RDT&E BUDGET ITEM JUSTIFICATION SHEET (R-2 Exhibit)		DATE	September 1996
APPROPRIATION/BUDGET ACTIVITY RDT&E, Defensewide BA 3 Advanced Technology Development		R-1 ITEM NOMENCLATURE Dual Use Applications Program, PE 0603805E, Project GC-01	
(U)	<u>Program Accomplishments and Plans:</u>		
(U)	FY 1996 Accomplishments: N/A		
(U)	FY 1997 Program: <ul style="list-style-type: none"> Potential technology thrusts (R&D areas) will be finalized based on the following criteria: 1) military utility; 2) potential commercial viability; and 3) prospects for timely acceptance by both military and commercial users after the DUAP R&D is completed. Competition(s) will be announced during the first quarter of FY 1997; projects will be selected by the fourth quarter of FY 1997. These R&D projects will be performed primarily by industry and be managed by a Military Service with ties to the expected military users. JDUPO's Service representatives will actively link the users and developers to help ensure the dual use benefits for each project, particularly performance, affordability, and accessibility. Technology thrusts for the FY 1998 competition will be selected in the fourth quarter of FY 1997. 		
(U)	FY 1998 Program: <ul style="list-style-type: none"> Early in FY 1998, JDUPO will sponsor competition(s) for R&D projects similar to that of FY 1997. JDUPO will sponsor demonstration and transition projects to directly encourage the insertion of dual use technologies into military systems. These projects would be developed and suggested by Service program managers and selected by JDUPO based on such things as: 1) military benefit; 2) commercial leverage; 3) defense user interest/commitment; 4) technical feasibility; 5) project plan. JDUPO will start sponsoring a wider variety of projects that leverage the commercial sector for the benefit of the military in some essential way. The scope of these projects will cover R&D, demonstrations, and the adaption of Non-Development-Items for military use. The goal will be to encourage leveraging the commercial sector in the widest variety of acquisition situations throughout the DOD. These projects will be suggested by Service program managers and acquisition offices, and selected for JDUPO sponsorship via criteria similar to those in the bullet above; the Services, not JDUPO, would manage any competitions to fund these projects. 		
(U)	FY 1999 Program: <ul style="list-style-type: none"> JDUPO will continue to sponsor R&D projects in FY 1999 but will increasingly emphasize execution and management by the Services, and relegate itself to a sponsorship, advocacy, and advice role.

(U) Mission Description: This program element is budgeted in the Management Support Budget Activity because it provides funding for the administrative support costs of the Defense Advanced Research Projects Agency. The funds provide for personnel compensation for civilians as well as costs for building rent, physical and information security, travel, supplies and equipment, communications, printing and reproduction. In addition, funds are included for reimbursing the Military Services for administrative support costs associated with contracts undertaken on the Agency's behalf.

(U) Program Accomplishments and Plans:(U) FY 1996 Accomplishments:

- Funding under this program element in FY 1996 supported management and administration for the RDT&E programs assigned to DARPA. The majority of the funds were required for the pay of personnel who operate the Agency. The funding level reflects the rental costs associated with the expansion of office space, and the related support and security requirements.

(U) FY 1997 Program:

- DARPA will continue the management and administrative support efforts for headquarters at approximately the same level as FY 1996 as well as enhanced physical and information security requirements. Increases reflect annualization of increased support begun in FY 1996.

(U) FY 1998 Program:

- DARPA will continue the management and administrative support efforts for headquarters at approximately the same levels as FY 1997. The funding level reflects increased rent and pay raise requirements.

(U) FY 1999 Program:

- DARPA will continue the management and administrative support efforts for headquarters at approximately the same levels as FY 1998. The funding level reflects pay raise requirements.
